Introduction

The Titanium Ti35 FPGA features the high-density, low-power Efinix® Quantum™ compute fabric wrapped with an I/O interface in a small footprint package for easy integration. Ti35 FPGAs are designed for highly integrated mobile and edge devices that need low power, a small footprint, and a multitude of I/Os. With ultra-low power Ti35 FPGAs, designers can build products that are always on, providing enhanced capabilities for applications such as mobile, edge, AI IoT, and sensor fusion.

Features

- High-density, low-power Quantum™ compute fabric
- Built on TSMC 16 nm process
- 10-kbit high-speed, embedded SRAM, configurable as single-port RAM, simple dual-port RAM, true dual-port RAM, or ROM
- High-performance DSP blocks for multiplication, addition, subtraction, accumulation, and up to 15-bit variable-right-shifting
- Versatile on-chip clocking
 - Low-skew global network supporting 32 clock or control signals
 - Regional and local clock networks
 - PLL support
- FPGA interface blocks
 - High-voltage I/O (HVIO) (1.8, 2.5, 3.3 V)
 - High-speed I/O (HSIO), configurable as:
 - LVDS, subLVDS, Mini-LVDS, and RSDS (RX, TX, and bidirectional), up to 1.5 Gbps
 - MIPI lane I/O (DSI and CSI) in high-speed (HS) low-power (LP) modes, up to 1.5 Gbps
 - Single-ended and differential I/O
 - PLL
 - Oscillator
- Flexible device configuration
 - Standard SPI interface (active, passive, and daisy chain⁽¹⁾)
 - JTAG interface
 - Supports internal reconfiguration
- Single-event upset (SEU) detection feature
- Fully supported by the Efinity® software, an RTL-to-bitstream compiler
- Optional security feature
 - Asymmetric bitstream authentication using RSA-4096
 - Bitstream encryption/decryption using AES-GCM

Important: All specifications are preliminary and pending hardware characterization.

⁽¹⁾ Daisy-chain is not supported in F100S3F2 package.

Table 1: Ti35 FPGA Resources

Logic Elements (LEs)	eXchangeable Logic and Routing (XLR) Cells		Global Clock and Control Signals	Embedded Memory (Mbits)	Embedded Memory Blocks (10 Kbits)	Embedded DSP Blocks
	Total	SRL8 ⁽²⁾				
36,176	35,467	8,586	Up to 32	1.53	149	93

Table 2: Ti35 Package-Dependent Resources

Resource		BGA100	BGA225
Single-ended GPIO (Max)	HVIO (1.8, 2.5, 3.0, 3.3 V LVCMOS, 3.0, 3.3 V LVTTTL)	-	23
	HSIO (1.2, 1.5, 1.8 V LVCMOS, HSTL and SSTL)	61	140
Differential GPIO (Max)	HSIO (LVDS, Differential HSTL, SSTL, MIPI D-PHY TX Data and Clock Lanes)	30	70
	HSIO (MIPI D-PHY RX Data Lanes)	21	58
	HSIO (MIPI D-PHY RX Clock Lanes)	3	12
Global clock or control signals from GPIO pins		8	15
PLLs		3	4

Learn more: Refer to the [Titanium Packaging User Guide](#) for the package outlines and markings.

Available Package Options

Table 3: Available Packages

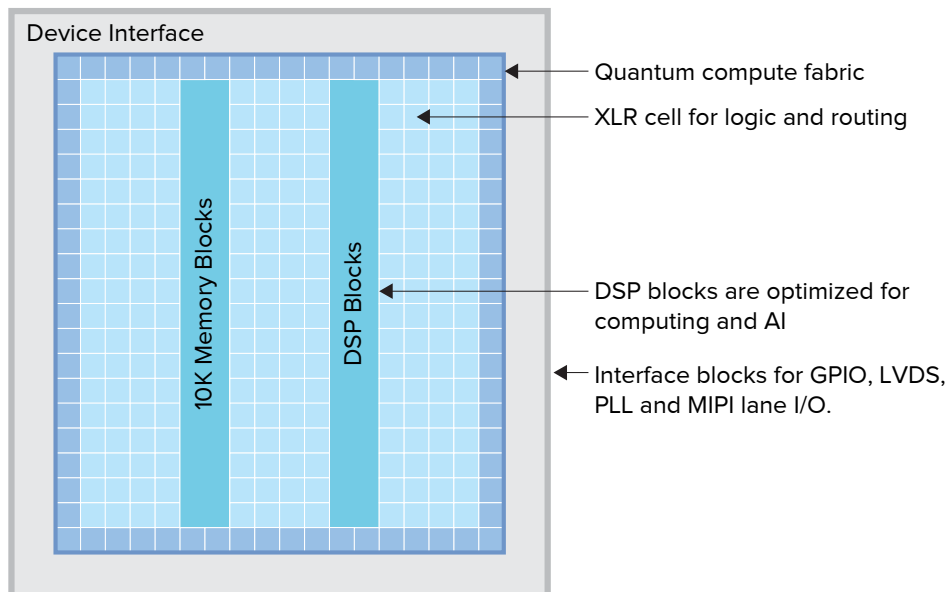

Package	Dimensions (mm x mm)	Pitch (mm)
100-ball FBGA	5.5 x 5.5	0.5
225-ball FBGA	10 x 10	0.65

⁽²⁾ Number of XLR that can be configured as shift register with 8 maximum taps.

Device Core Functional Description

Ti35 FPGAs feature an eXchangeable Logic and Routing (XLR) cell that Efinix® has optimized for a variety of applications. Titanium FPGAs contain LEs that are constructed from XLR cells. Each FPGA in the Titanium family has a custom number of building blocks to fit specific application needs. As shown in the following figure, the FPGA includes I/O ports on all four sides, as well as columns of LEs, memory, and DSP blocks. A control block within the FPGA handles configuration.

Figure 1: Ti35 FPGA Block Diagram

XLR Cell

The eXchangeable Logic and Routing (XLR) cell is the basic building block of the Quantum™ architecture. The Efinix® XLR cell combines logic and routing and supports both functions. This unique innovation greatly enhances the transistor flexibility and utilization rate, thereby reducing transistor counts and silicon area significantly.

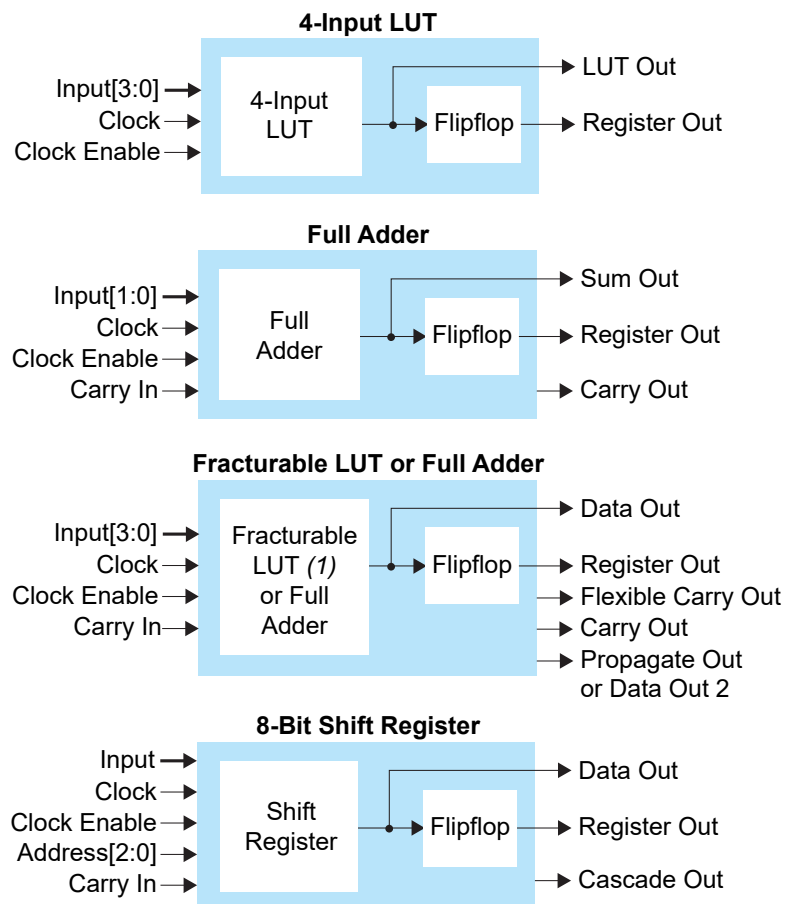

Learn more: For more detailed on the advantages the XLR cell brings to Titanium FPGAs, read the [Why the XLR Cell is a Big Deal White Paper](#).

The XLR cell functions as:

- A 4-input LUT that supports any combinational logic function with four inputs.
- A simple full adder.
- An 8-bit shift register that can be cascaded.
- A fracturable LUT or full adder.

The logic cell includes an optional flipflop. You can configure multiple logic cells to implement arithmetic functions such as adders, subtractors, and counters.

Figure 2: Logic Cell Functions

1. The fracturable LUT is a combination of a 3-input LUT and a 2-input LUT. They share 2 of the same inputs.

Learn more: Refer to the [Quantum Titanium Primitives User Guide](#) for details on the Titanium logic cell primitives.

Embedded Memory

The core has 10-kbit high-speed, synchronous, embedded SRAM memory blocks. Memory blocks can operate as single-port RAM, simple dual-port RAM, true dual-port RAM, or ROM. You can initialize the memory content during configuration. The Efinity[®] software includes a memory cascading feature to connect multiple blocks automatically to form a larger array. This feature enables you to instantiate deeper or wider memory modules.

Note: The block RAM content is random and undefined if it is not initialized.

The read and write ports support independently configured data widths, an address enable, and an output register reset. The simple dual-port mode also supports a write byte enable.

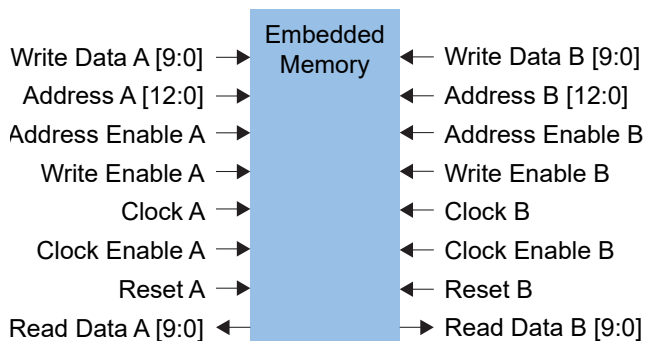

Learn more: Refer to the [Quantum Titanium Primitives User Guide](#) for details on the RAM configuration.

True Dual-Port Mode

The memory read and write ports have the following modes for addressing the memory (depth x width):

1024 x 8	2048 x 4	4096 x 2
8192 x 1	1024 x 10	2048 x 5

Figure 3: RAM Block Diagram (True Dual-Port Mode)

Simple Dual-Port Mode

The memory read and write ports have the following modes for addressing the memory (depth x width):

512 x 16	1024 x 8	2048 x 4	4096 x 2
8192 x 1	512 x 20	1024 x 10	2048 x 5

Figure 4: Simple Dual-Port Mode RAM Block Diagram (512 x 20 Configuration)

DSP Block

The Titanium FPGA has high-performance, complex DSP blocks that can perform multiplication, addition, subtraction, accumulation, and 4-bit variable right shifting. The 4-bit variable right shift supports one lane in normal mode, two lanes in dual mode and four lanes in quad mode. Each DSP block has four modes, which support the following multiplication operations:

- *Normal*—One 19 x 18 integer multiplication with 48-bit addition/subtraction.
- *Dual*—One 11 x 10 integer multiplication and one 8 x 8 integer multiplication with two 24-bit additions/subtractions.
- *Quad*—One 7 x 6 integer multiplication and three 4 x 4 integer multiplications with four 12-bit additions/subtractions.
- *Float*—One fused-multiply-add/subtract/accumulate (FMA) BFLOAT16 multiplication.

The integer multipliers can represent signed or unsigned values based on the `SIGNED` parameter. When multiple `EFX_DSP12` or `EFX_DSP24` primitives are mapped to the same DSP block, they must have the same `SIGNED` value. The inputs to the multiplier are the A and B data inputs. Optionally, you can use the result of the multiplier in an addition or subtraction operation.

Figure 5: DSP Block Diagram

Learn more: Refer to the [Quantum Titanium Primitives User Guide](#) for more information about the Titanium DSP block primitives.

Clock and Control Network

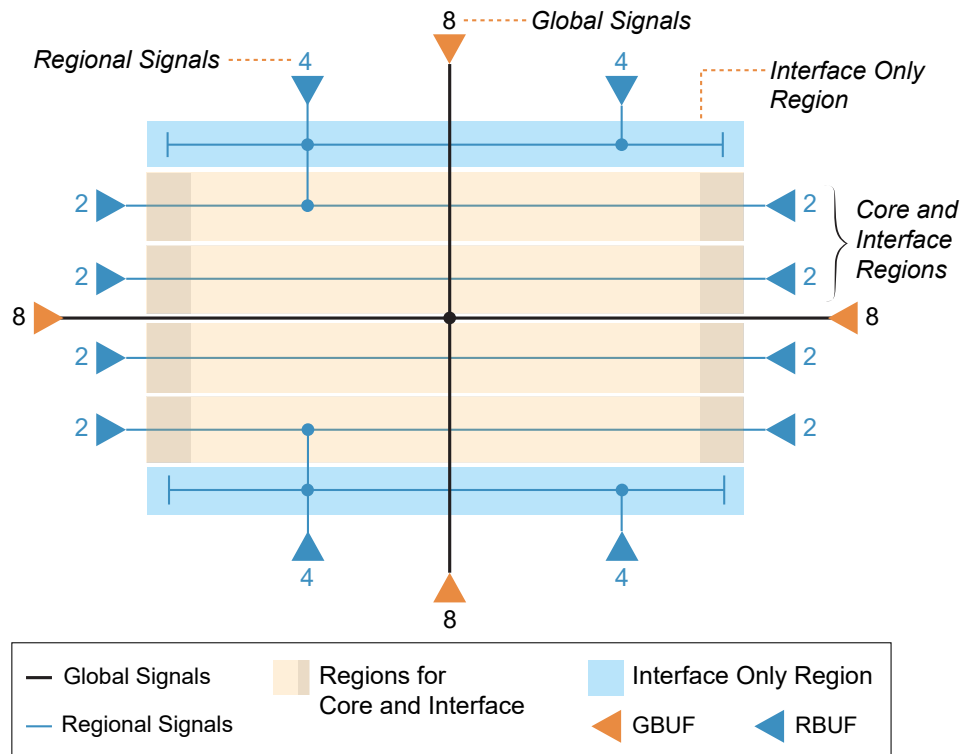

The clock and control network is distributed through the FPGA to provide clocking for the core's LEs, memory, DSP blocks, I/O blocks, and control signals. The FPGA has 32 global signals that can be used as either clocks or control signals. The global signals are balanced trees that feed the whole FPGA.

The FPGA also has regional signals that can only reach certain FPGA regions, including the top or bottom edges. The FPGA has 4 regional networks for the core, right interface, and left interface blocks. The top and bottom interface blocks have 1 regional clock network each. You can drive the right and left sides of each region independently. Each region also has a local network of clock signals that can only be used in that region.

The core's global buffer (GBUF) blocks drive the global and regional networks. Signals from the core and interface can drive the GBUF blocks.

Each network has dedicated enable logic to save power by disabling the clock tree. The logic dynamically enables/disables the network and guarantees no glitches at the output.

Figure 6: Global and Regional Clock Network Overview

Clock Sources that Drive the Global and Regional Networks

The Titanium global and regional networks are highly flexible and configurable. Clock sources can come from interface blocks, such as GPIO or PLLs, or from the core fabric.

Table 4: Clock Sources that Drive the Global and Regional Networks

Source	Description
GPIO	Supports GCLK and RCLK. (Only the P resources support this connection type).
LVDS RX	Supports GCLK and RCLK.
MIPI RX Lane (configured as clock lane)	Supports GCLK (default) and RCLK. You can only use resources that are identified as clocks.
PLL	Output clocks 0 - 3 connect to the global network. Output clock 4 only connects to the regional network in the top or bottom interface regions (depending on the location of the PLL) and can only drive interface blocks on the top or bottom of the FPGA. Refer to Driving the Regional Network on page 16 for the PLL clocks that drive the regional network.
Oscillator	Connects to global buffer.
Core	Signals from the core logic can drive the global or regional network.

Driving the Global Network

You can access the global clock network using the global clock GPIO pins, PLL outputs, oscillator output, MIPI word clocks, and core-generated clocks.

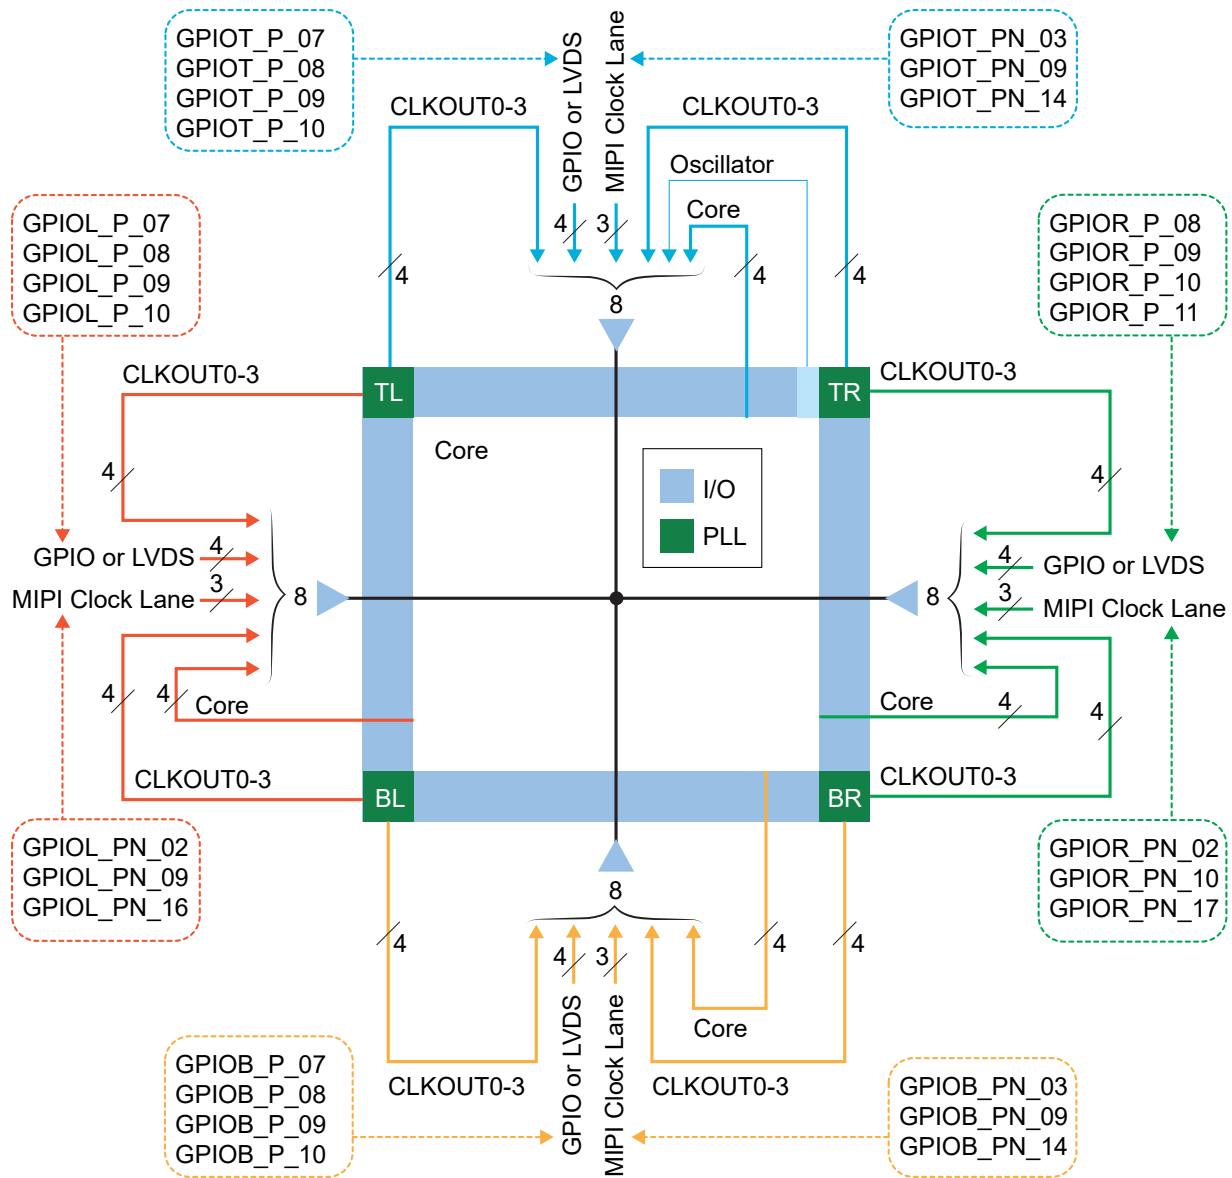

A clock multiplexing network controls which interface blocks can drive the global and regional networks. Eight of the clock multiplexers are dynamic (two on each side of the FPGA), allowing you to change which clock drives the global signal in user mode.

Learn more: Refer to the [Quantum Titanium Primitives User Guide](#) for information on how to configure the global and regional clock networks.

The following figure shows the global network clock sources graphically.

Figure 7: Clock Sources that Drive the Global Network

Note: The Ti60ES oscillator can only drive the core.

As the figure shows, numerous clock sources feed the global network. These signals are multiplexed together with static and dynamic clock multiplexers.

The dynamic multiplexers are configurable by the user at run-time. You can choose which clock source drives which input to the dynamic multiplexer. When you enable the dynamic multiplexer, you specify a select bus to choose which clock source is active. You must assign the first toggling clock to input 0 of every enabled dynamic clock multiplexer.

The following figures show the resources that drive each multiplexer.

Figure 8: Clock Sources that Drive the Multiplexers: Top

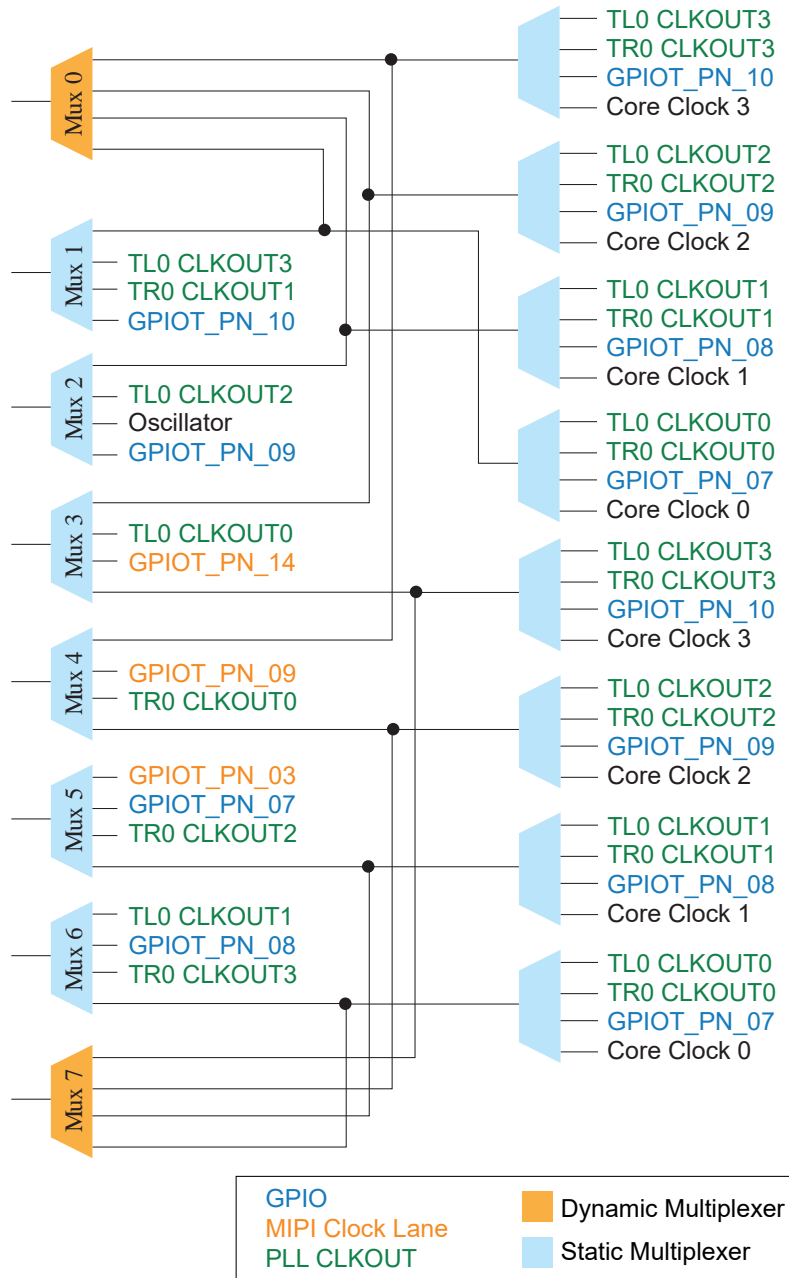

Figure 9: Clock Sources that Drive the Multiplexers: Bottom

Figure 10: Clock Sources that Drive the Multiplexers: Left

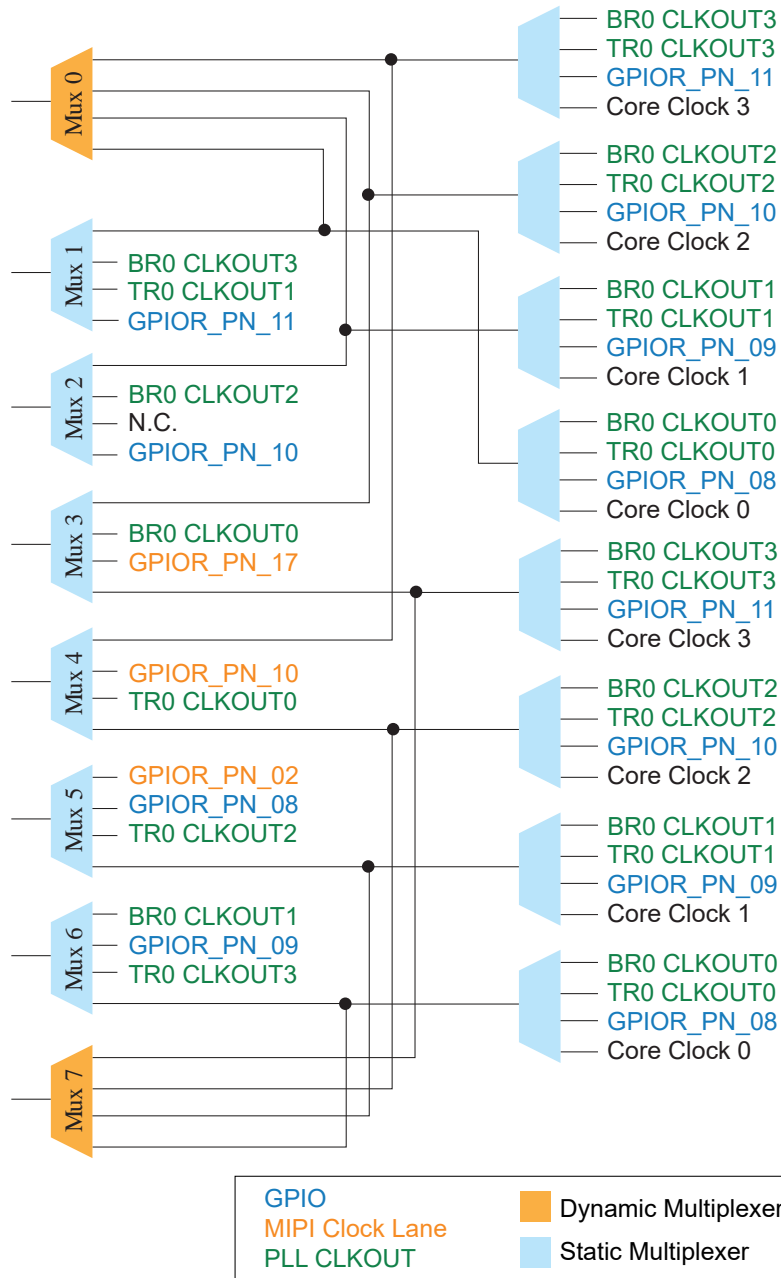

Figure 11: Clock Sources that Drive the Multiplexers: Right

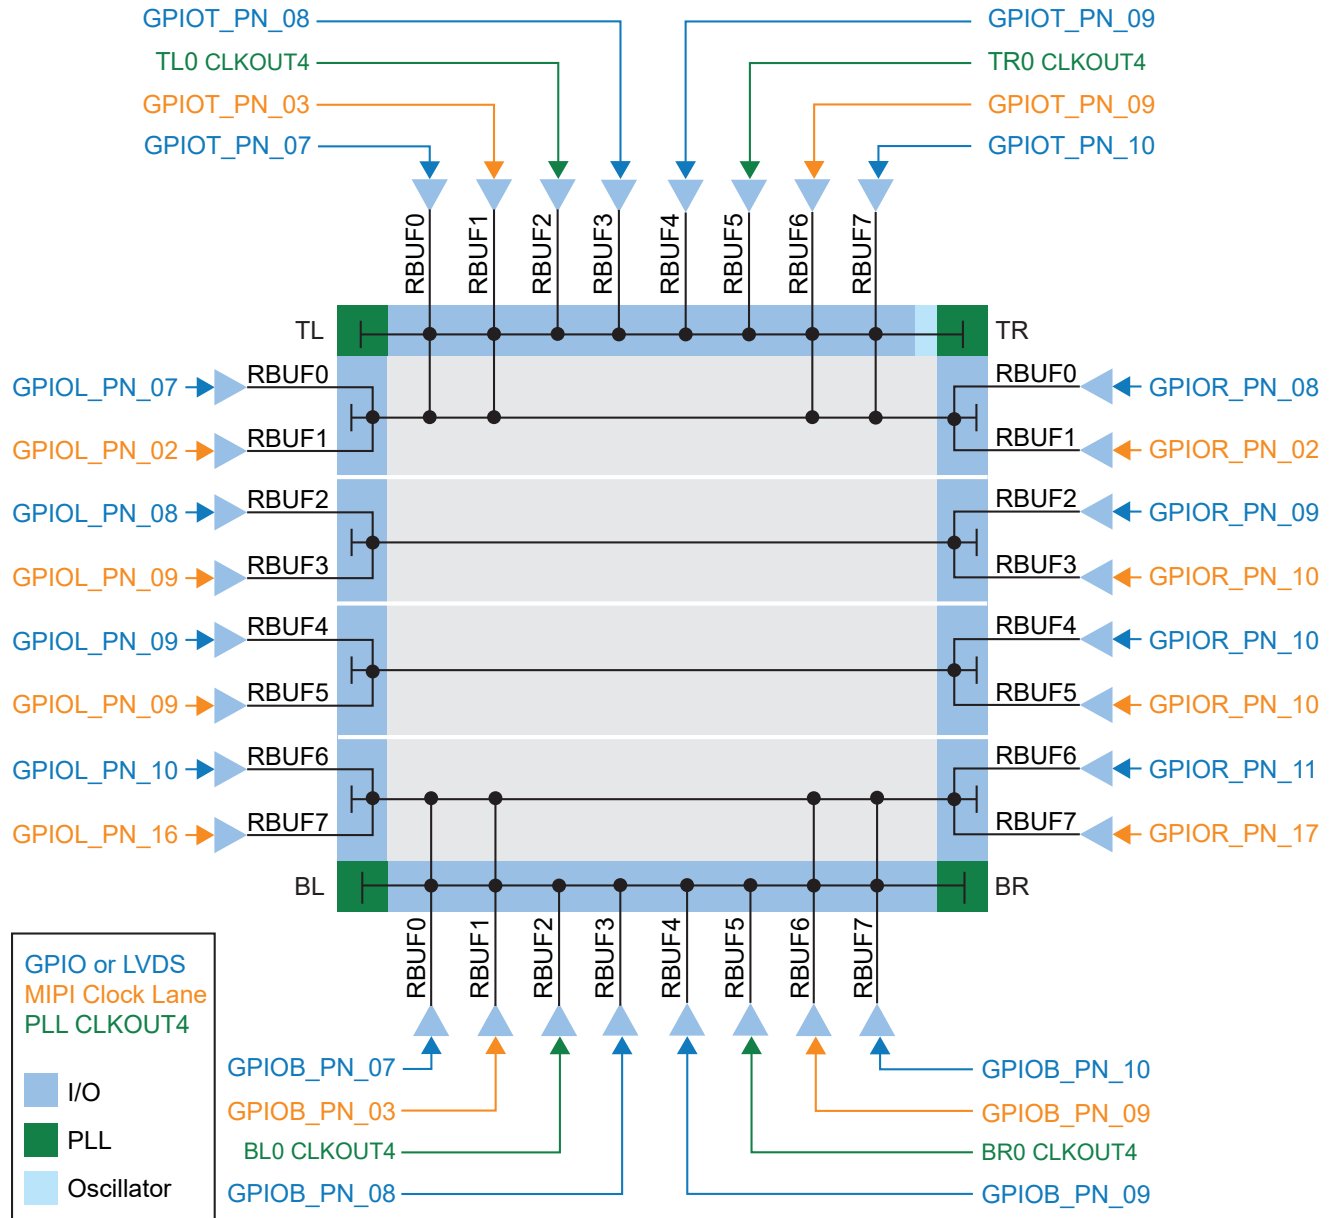

Driving the Regional Network

The following figure shows the regional network clock sources graphically.

The PLL CLKOUT4 can only connect to the top (or bottom) interface.

Figure 12: Clock Sources that Drive the Regional Network

Driving the Local Network

As described previously, the FPGA has horizontal clock regions. The top and bottom regions are **only** for the top and bottom interfaces. The other regions are for the core logic (XLR cells, DSP Blocks, and RAM) and the interfaces on the sides.

Local Network for Core Logic

As shown in the following figure, the regions that contain the core logic are 80 XLR cells tall, and the local network connects an area that is 40 XLR cells tall. Additionally, each column has its own local network. For example, in the first column, XLR cells 1 - 40 are in the same local network and XLR cells 41 - 80 are in another local network. DSP Blocks and RAM also have their own local networks. This pattern of block/local network is repeated for each column in the die.

Figure 13: Clock Sources for Logic, DSP Blocks, and RAM

There are 16 signals that can feed the local networks. These signals can come from several sources:

- The global network (32 possible signals)
- The core fabric in another region (16 possible signals)
- The regional network (4 or 8 possible signals). For the top and bottom regions 8 signals can come from the regional network. For the other regions, 4 signals can come from the regional network. (Refer back to **Clock and Control Network** on page 9.)

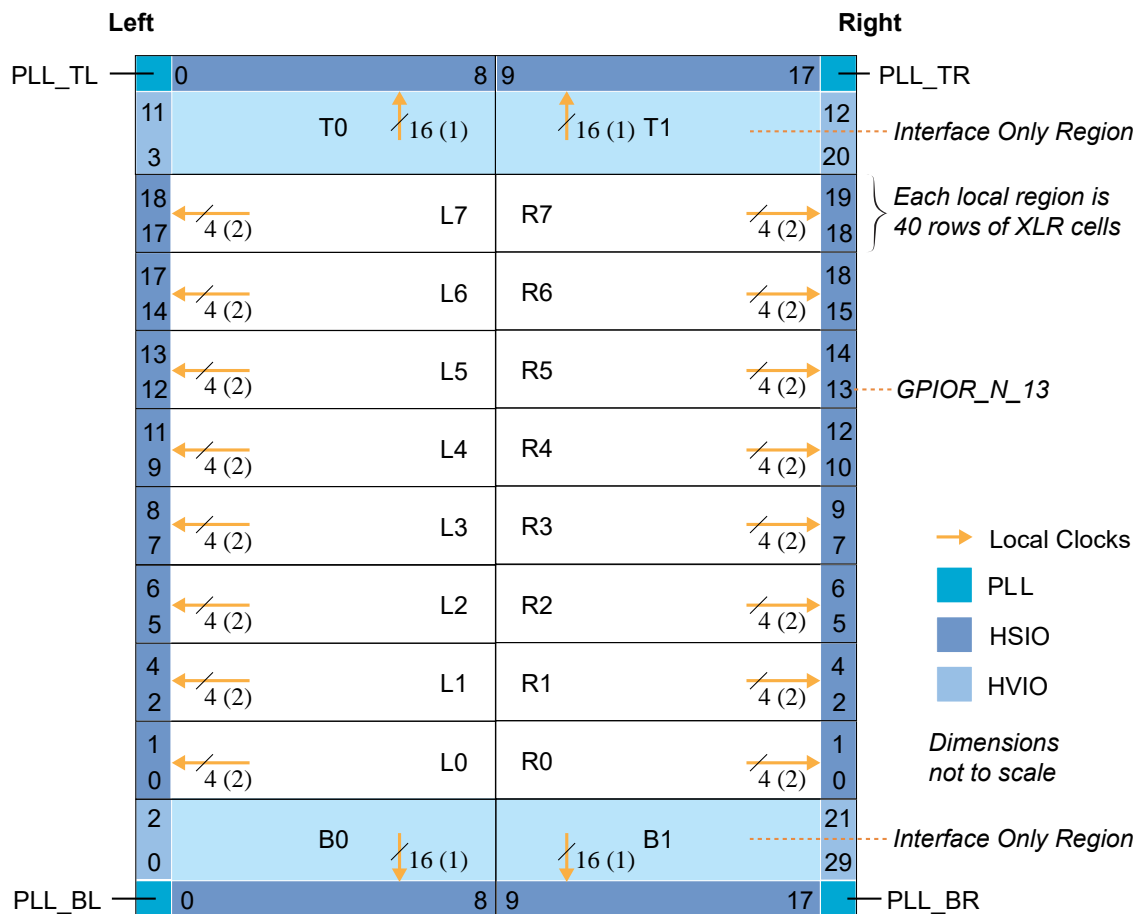

Additionally, the local fabric can generate clock and control signals for the local network. The fabric can also drive the clock enable for the XLR cell directly, allowing each XLR cell to have a unique clock enable.

Local Network for Interface Regions

The following figure shows the local clock networks for the interface blocks. There are a limited number of unique clocks per local clock region.

- The top and bottom regions can each support up to 16 unique clock signals; 14 from the global network and 2 from the fabric.
- The left and right regions can each support up to 4 unique clock signals. Up to 2 can come from the routing fabric, the rest come from the global or regional buffers. These regions are the same height as the core local regions (that is, 40 rows).

Figure 14: Clock Sources that Drive the Interfaces

Note:

1. 14 signals come from the global network; 2 come from the routing fabric.
2. Up to 2 signals can come from the routing fabric. The rest come from the regional/global buffer.

Device Interface Functional Description

The device interface wraps the core and routes signals between the core and the device I/O pads through a signal interface. Because they use the flexible Quantum™ architecture, devices in the Titanium family support a variety of interfaces to meet the needs of different applications.

Learn more: The following sections describe the available device interface features in Ti35 FPGAs. Refer to the [Titanium Interfaces User Guide](#) for details on the Efinity® Interface Designer settings.

Interface Block Connectivity

The FPGA core fabric connects to the interface blocks through a signal interface. The interface blocks then connect to the package pins. The core connects to the interface blocks using three types of signals:

- *Input*—Input data or clock to the FPGA core
- *Output*—Output from the FPGA core
- *Clock output*—Clock signal from the core clock tree

Figure 15: Interface Block and Core Connectivity

GPIO blocks are a special case because they can operate in several modes. For example, in alternate mode the GPIO signal can bypass the signal interface and directly feed another interface block. So a GPIO configured as an alternate input can be used as a PLL reference clock without going through the signal interface to the core.

When designing for Titanium FPGAs, you create an RTL design for the core and also configure the interface blocks. From the perspective of the core, outputs from the core are inputs to the interface block and inputs to the core are outputs from the interface block.

The Efinity netlist always shows signals from the perspective of the core, so some signals do not appear in the netlist:

- GPIO used as reference clocks are not present in the RTL design, they are only visible in the interface block configuration of the Efinity® Interface Designer.

- The FPGA clock tree is connected to the interface blocks directly. Therefore, clock outputs from the core to the interface are not present in the RTL design, they are only part of the interface configuration (this includes GPIO configured as output clocks).

The following sections describe the different types of interface blocks in the Ti35. Signals and block diagrams are shown from the perspective of the interface, not the core.

GPIO

The Ti35 FPGA supports two types of GPIO:

- *High-voltage I/O (HVIO)*—Simple I/O blocks that can support single-ended I/O standards.
- *High-speed I/O (HSIO)*—Complex I/O blocks that can support single-ended and differential I/O functionality.

The I/O logic comprises three register types:

- *Input*—Capture interface signals from the I/O before being transferred to the core logic
- *Output*—Register signals from the core logic before being transferred to the I/O buffers
- *Output enable*—Enable and disable the I/O buffers when I/O used as output

The HVIO supports the following I/O standards.

Table 5: HVIO Supported Standards

Standard	VCCIO33 (V)	When Configured As
LVTTTL 3.3 V	3.3	GPIO
LVTTTL 3.0 V	3.0	GPIO
LVC MOS 3.3 V	3.3	GPIO
LVC MOS 3.0 V	3.0	GPIO
LVC MOS 2.5 V	2.5	GPIO
LVC MOS 1.8 V	1.8	GPIO

Important: Efinix recommends that you limit the number of 3.0/3.3 V HVIO as I/O or output to 6 per bank to avoid switching noise. The Efinity[®] software issues a warning if you exceed the recommended limit.

The HSIO supports the following I/O standards.

Table 6: HSIO Supported I/O Standards

Standard	VCCIO (V)		VCCAUX (V)	VREF (V)	When Configured As
	TX	RX			
LVCMOS 1.8 V	1.8	1.8	1.8	-	GPIO
LVCMOS 1.5 V	1.5	1.5	1.8	-	GPIO
LVCMOS 1.2 V	1.2	1.2	1.8	-	GPIO
HSTL/Differential HSTL 1.8 V SSTL/Differential SSTL 1.8 V	1.8	1.8	1.8	0.9	GPIO
HSTL/Differential HSTL 1.5 V SSTL/Differential SSTL 1.5 V	1.5	1.5, 1.8 ⁽³⁾	1.8	0.75	GPIO
HSTL/Differential HSTL 1.2 V SSTL/Differential SSTL 1.2 V	1.2	1.2, 1.5, 1.8 ⁽³⁾	1.8	0.6	GPIO
LVDS/RSDS/mini-LVDS	1.8	1.5, 1.8 ⁽³⁾	1.8	-	LVDS
Sub-LVDS	1.8	1.5, 1.8 ⁽³⁾	1.8	-	LVDS
MIPI/SLVS	1.2	1.2	1.8	-	MIPI Lane

The differential receivers are powered by VCCAUX, which gives you the flexibility to choose the VCCIO you want to use. However, you must comply to the requirements stated in the previous table.

⁽³⁾ To prevent pin leakage, you must ensure that the voltage at the pin does not exceed VCCIO.

Features for HVIO and HSIO Configured as GPIO

The following table describes the features supported by HVIO and HSIO configured as GPIO.

Table 7: Features for HVIO and HSIO Configured as GPIO

Feature	HVIO	HSIO Configured as GPIO
Double-data I/O (DDIO)	✓	✓
Dynamic pull-up	-	✓
Pull-up/Pull-down	✓	✓
Slew-Rate Control	-	✓
Variable Drive Strength	✓	✓
Schmitt Trigger	✓	✓
1:4 Serializer/Deserializer (Full rate mode only)	-	✓
Programmable Bus Hold	-	✓
Static Programmable Delay Chains	✓	✓
Dynamic Programmable Delay Chains	-	✓

Table 8: GPIO Modes

GPIO Mode	Description
Input	<p>Only the input path is enabled; optionally registered. If registered, the input path uses the input clock to control the registers (positively or negatively triggered).</p> <p>Select the alternate input path to drive the alternate function of the GPIO. The alternate path cannot be registered.</p> <p>In DDIO mode, two registers sample the data on the positive and negative edges of the input clock, creating two data streams.</p>
Output	<p>Only the output path is enabled; optionally registered. If registered, the output path uses the output clock to control the registers (positively or negatively triggered).</p> <p>The output register can be inverted.</p> <p>In DDIO mode, two registers capture the data on the positive and negative edges of the output clock, multiplexing them into one data stream.</p>
Bidirectional	<p>The input, output, and OE paths are enabled; optionally registered. If registered, the input clock controls the input register, the output clock controls the output and OE registers. All registers can be positively or negatively triggered. Additionally, the input and output paths can be registered independently.</p> <p>The output register can be inverted.</p>
Clock output	Clock output path is enabled.

During configuration, all GPIO pins are configured in weak pull-up mode.

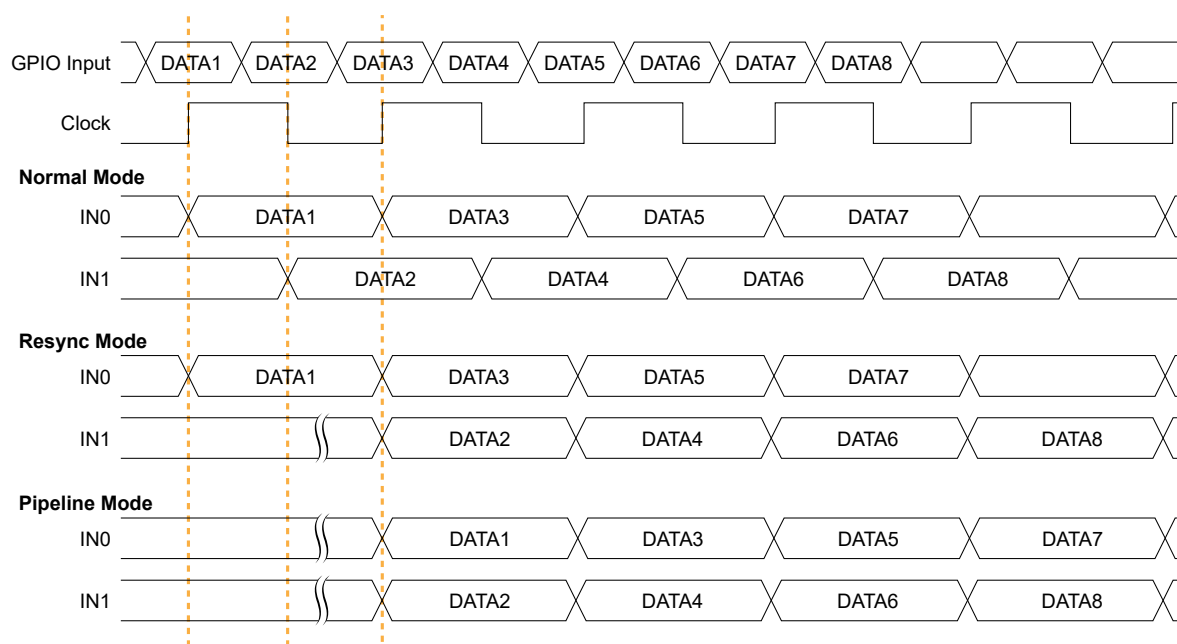

During user mode, unused GPIO pins are tristated and configured in weak pull-up mode. You can change the default mode to weak pull-down in the Interface Designer.

Double-Data I/O

Ti35 FPGAs support double data I/O (DDIO) on input and output registers. In this mode, the DDIO register captures data on both positive and negative clock edges. The core receives 2 bit wide data from the interface.

In normal mode, the interface receives or sends data directly to or from the core on the positive and negative clock edges. In resync and pipeline mode, the interface resynchronizes the data to pass both signals on the positive clock edge only.

Figure 16: DDIO Input Timing Waveform

In resync mode, the IN1 data captured on the falling clock edge is delayed one half clock cycle.

In the Interface Designer, IN0 is the HI pin name and IN1 is the LO pin name.

Figure 17: DDIO Output Timing Waveform

In the Interface Designer, OUT0 is the HI pin name and OUT1 is the LO pin name.

Programmable Delay Chains

The HSIO configured as GPIO supports programmable delay chain. In some cases you can use static and dynamic delays at the same time.

Table 9: Programmable Delay Support

Delay Type	GPIO Type	Description
Static	Single-ended	16 steps with approximately 60 ps of delay per step, both input and output paths.
	Differential RX	64 steps of approximately 25 ps delay per step. You cannot use the static and dynamic delay at the same time. Available only on P input of the HSIO pin pair.
	Differential TX	64 steps with approximately 25 ps of delay per step.
Dynamic	Single ended and differential	64 steps with approximately 25 ps of delay per step, input only. Only available on input (RX) delay; available only on P input of the HSIO pin pair.

HVIO

The HVIOs are grouped into banks. Each bank has its own VCCIO33 that sets the bank voltage for the I/O standard. Each HVIO consists of I/O logic and an I/O buffer. I/O logic connects the core logic to the I/O buffers. I/O buffers are located at the periphery of the device.

Figure 18: HVIO Interface Block

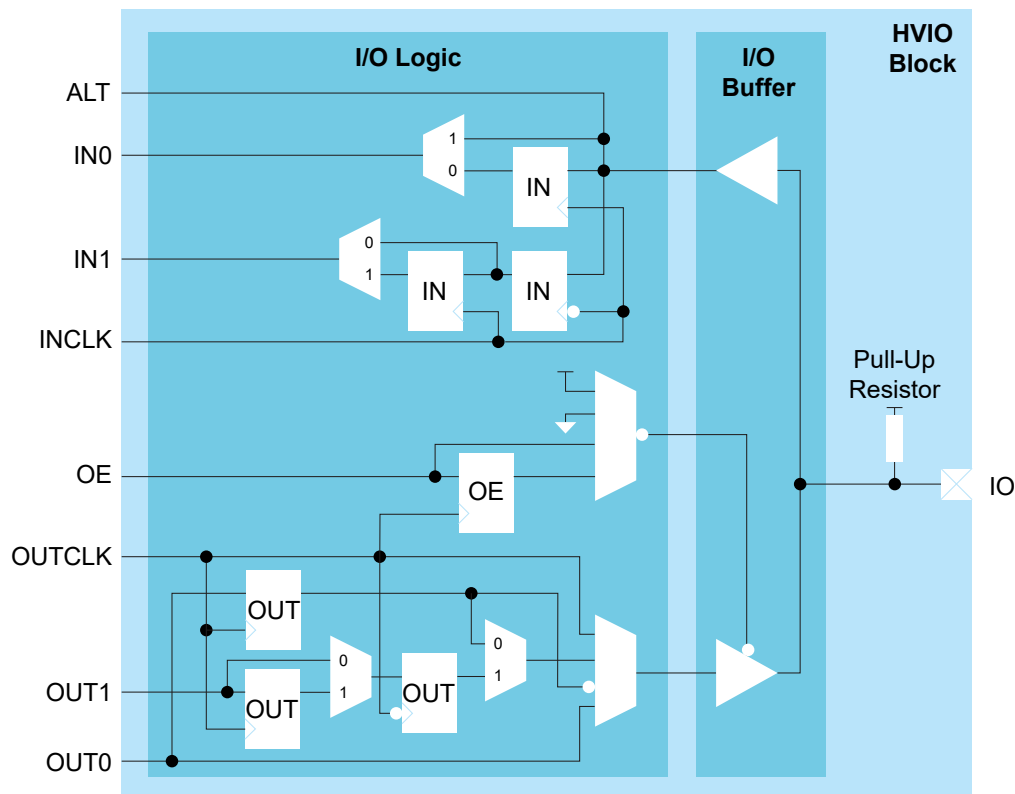

Table 10: HVIO Signals (Interface to FPGA Fabric)

Signal	Direction	Description
IN[1:0]	Output	Input data from the HVIO pad to the core fabric. IN0 is the normal input to the core. In DDIO mode, IN0 is the data captured on the positive clock edge (HI pin name in the Interface Designer) and IN1 is the data captured on the negative clock edge (LO pin name in the Interface Designer).
ALT	Output	Alternative input connection (in the Interface Designer, Register Option is none). HVIO only support pll_clkln as the alternative connection.
OUT[1:0]	Input	Output data to HVIO pad from the core fabric. OUT0 is the normal output from the core. In DDIO mode, OUT0 is the data captured on the positive clock edge (HI pin name in the Interface Designer) and OUT1 is the data captured on the negative clock edge (LO pin name in the Interface Designer).
OE	Input	Output enable from core fabric to the I/O block. Can be registered.
OUTCLK	Input	Core clock that controls the output and OE registers. This clock is not visible in the user netlist.
INCLK	Input	Core clock that controls the input registers. This clock is not visible in the user netlist.

Table 11: HVIO Pads

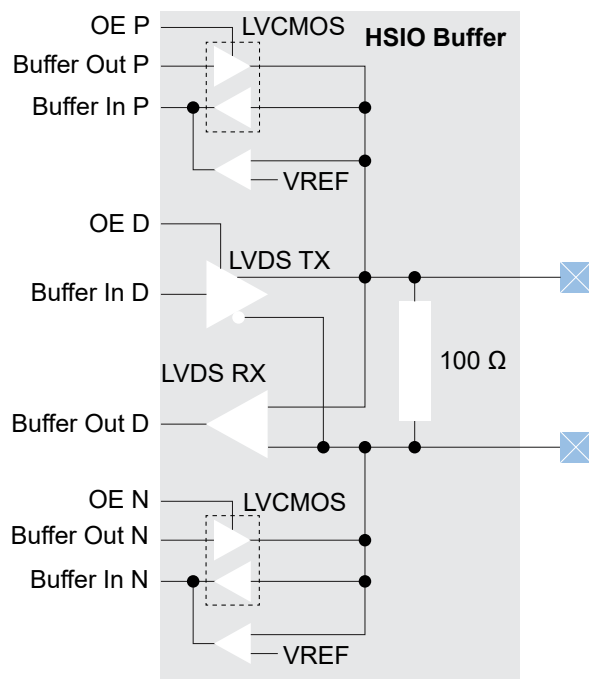

Signal	Direction	Description
IO	Bidirectional	HVIO pad.

HSIO

Each HSIO block uses a pair of I/O pins as one of the following:

- *Single-ended HSIO*—Two single-ended I/O pins (LVCMOS, SSTL, HSTL)
- *Differential HSIO*—One differential I/O pins:
 - Differential SSTL and HSTL
 - LVDS—Receiver (RX), transmitter (TX), or bidirectional (RX/TX)
 - MIPI lane I/O—Receiver (RX) or transmitter (TX)

Figure 19: HSIO Buffer Block Diagram

Important: When you are using an HSIO pin as a GPIO, make sure to leave at least 1 pair of unassigned HSIO pins between any GPIO and LVDS or MIPI lane pins. This rule applies for pins on each side of the device (top, bottom, left, right). This separation reduces noise. The Efinity software issues an error if you do not leave this separation.

HSIO Configured as GPIO

You can configure each HSIO block as two GPIO (single-ended) or one GPIO (differential).

Figure 20: I/O Interface Block

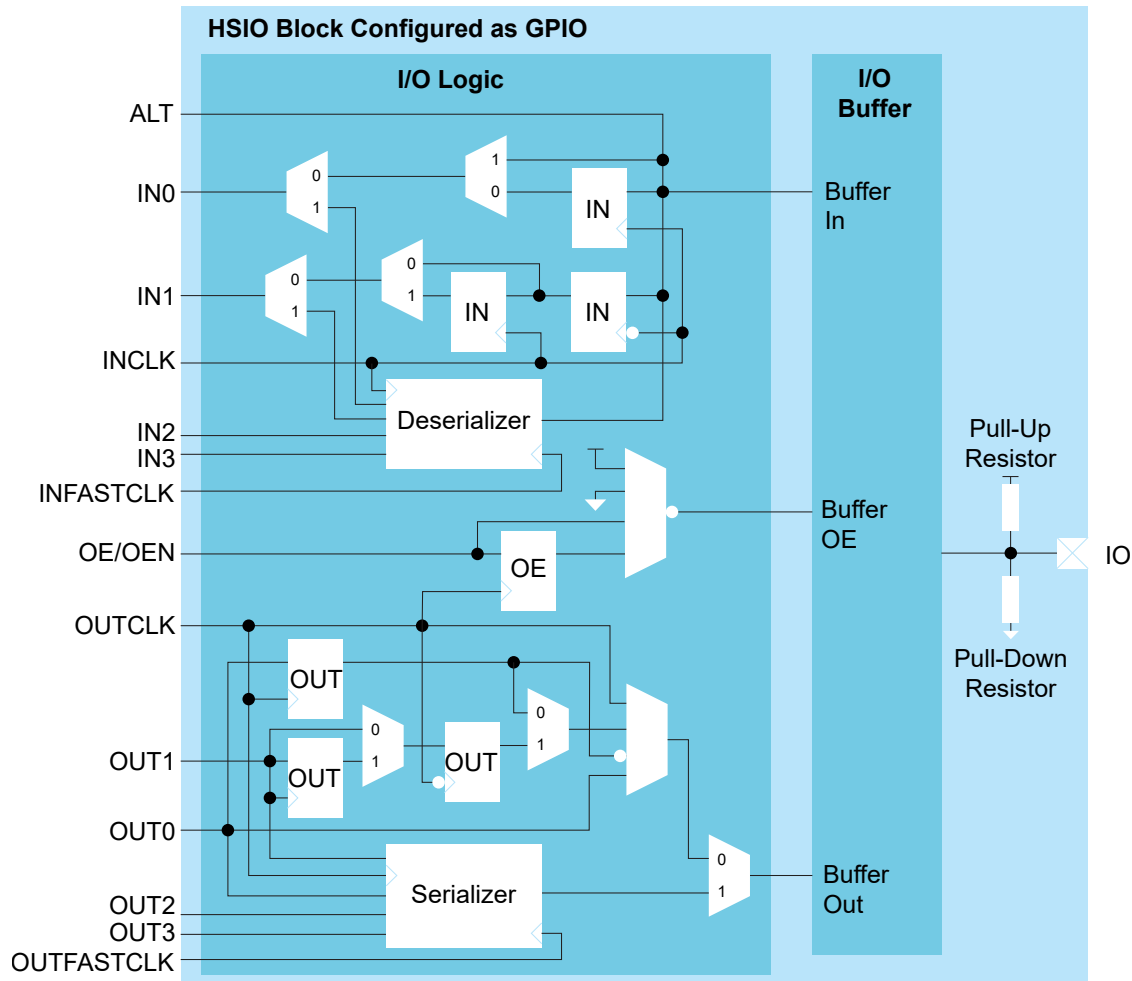

Table 12: HSIO Block Configured as GPIO Signals (Interface to FPGA Fabric)

Signal	Direction	Description
IN[3:0]	Output	Input data from the pad to the core fabric. IN0 is the normal input to the core. In DDIO mode, IN0 is the data captured on the positive clock edge (HI pin name in the Interface Designer) and IN1 is the data captured on the negative clock edge (LO pin name in the Interface Designer). When using the deserializer, the first bit is on IN0 and the last bit is on IN3.
ALT	Output	Alternative input connection for GCLK, PLL_CLKIN, RCLK, PLL_EXTFB, and VREF. (In the Interface Designer, Register Option is none).
OUT[3:0]	Input	Output data to GPIO pad from the core fabric. OUT0 is the normal output from the core. In DDIO mode, OUT0 is the data captured on the positive clock edge (HI pin name in the Interface Designer) and OUT1 is the data captured on the negative clock edge (LO pin name in the Interface Designer). When using the serializer, the first bit is on OUT0 and the last bit is on OUT3.
OE/OEN	Input	Output enable from core fabric to the I/O block. Can be registered. OEN is used in differential mode. Drive it with the same signal as OE.
DLY_ENA	Input	(Optional) Enable the dynamic delay control.
DLY_INC	Input	(Optional) Dynamic delay control. When DLY_ENA = 1, 1: Increments 0: Decrements
DLY_RST	Input	(Optional) Reset the delay counter.
OUTCLK	Input	Core clock that controls the output and OE registers. This clock is not visible in the user netlist.
OUTFASTCLK	Input	Core clock that controls the output serializer.
INCLK	Input	Core clock that controls the input registers. This clock is not visible in the user netlist.
INFASTCLK	Input	Core clock that controls the input serializer.

Table 13: GPIO Pads

Signal	Direction	Description
IO (P and N)	Bidirectional	GPIO pad.

The signal path from the pad through the I/O buffer changes depending on the I/O standard you are using. The following figures show the paths for the supported standards. The blue highlight indicates the path.

Figure 21: I/O Buffer Path for LVCMOS

When using an HSI0 with the HSTL or SSTL I/O standards, you must configure an I/O pad of the standard's input path as a VREF pin. There is one programmable VREF per I/O bank.

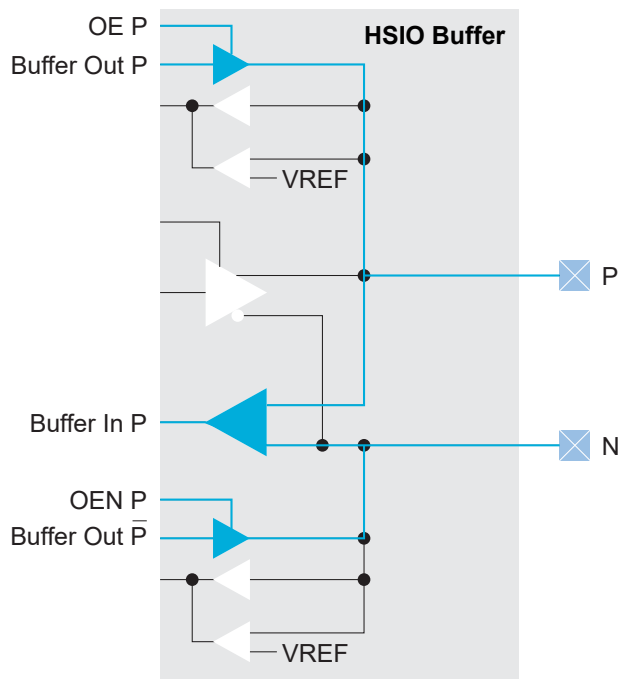

Important: When configuring an I/O pad of the standard's input path as a VREF pin, you must use the VREF from the same physical I/O bank even when the I/O banks are merged to share a common VCCIO pin.

Figure 22: I/O Buffer Path for HSTL and SSTL

When using an HSIO with the differential HSTL or differential SSTL standard, you must use both GPIO resources in the HSIO. You use the core interface pins associated with the P resource.

Figure 23: I/O Buffer Path for Differential HSTL and SSTL

HSIO Configured as LVDS

You can configure each HSIO block in RX, TX, or bidirectional LVDS mode. As LVDS, the HSIO has these features:

- Programmable V_{OD} , depending on the I/O standard used.
- Programmable pre-emphasis.
- Up to 1.5 Gbps.
- Programmable $100\ \Omega$ termination to save power (you can enable or disable it at runtime).
- LVDS input enable to dynamically enable/disable the LVDS input.
- Support for full rate or half rate serialization.
- Up to 10-bit serialization to support protocols such as 8b10b encoding.
- Programmable delay chains.
- Optional 8-word FIFO for crossing from the parallel (slow) clock to the user's core clock to help close timing (RX only).
- Dynamic phase alignment (DPA) that automatically eliminates skew for clock to data channels and data to data channels by adjusting a delay chain setting so that data is sampled at the center of the bit period. The DPA supports full-rate serialization mode only.

Table 14: Full and Half Rate Serialization

Mode	Description	Example
Full rate clock	In full rate mode, the fast clock runs at the same frequency as the data and captures data on the positive clock edge.	Data rate: 800 Mbps Serialization/Deserialization factor: 8 Slow clock frequency: 100 Mhz (800 Mbps / 8) Fast clock frequency: 800 Mhz
Half rate clock	In half rate mode, the fast clock runs at half the speed of the data and captures data on both clock edges.	Data rate: 800 Mbps Serialization / Deserialization factor: 8 Slow clock frequency: 100 Mhz (800 Mbps / 8) Fast clock frequency: 400 Mhz (800 / 2)

You use a PLL to generate the serial (fast) and parallel (slow) clocks for the LVDS pins. The slow clock runs at the data rate divided by the serialization factor.

Ti35 FPGAs do not have a dedicated LVDS clock tree; therefore, the fast and slow clocks must use global or regional clocks to feed the LVDS primitives.

LVDS RX

You can configure an HSIO block as one LVDS RX signal.

Figure 24: LVDS RX Interface Block Diagram

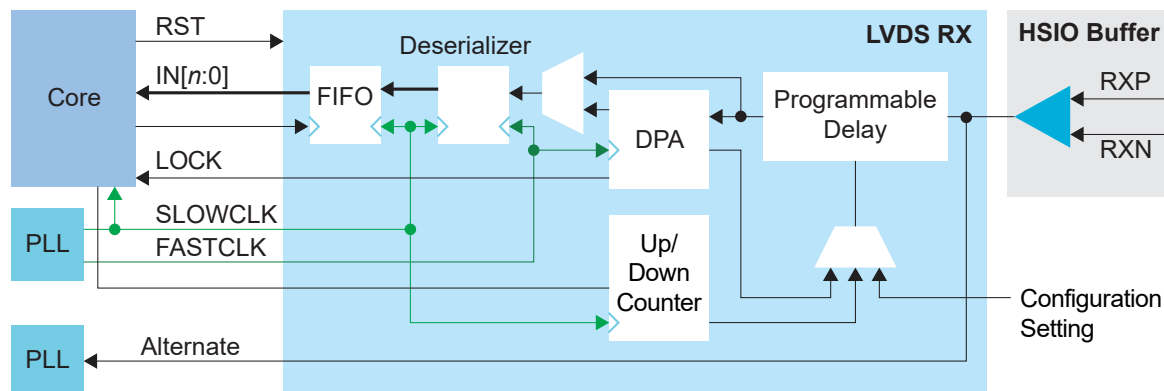

Table 15: LVDS RX Signals (Interface to FPGA Fabric)

Signal	Direction	Clock Domain	Description
IN[9:0]	Output	SLOWCLK	Parallel input data to the core. The width is programmable.
ALT	Output		Alternate input, only available for an LVDS RX resource in bypass mode (deserialization width is 1; alternate connection type). Alternate connections are PLL_CLKIN, PLL_EXTFB, GCLK, and RCLK.
LOCK	Output		(Optional) When DPA is enabled, this signal indicates that the DPA has achieved training lock and data can be passed.
FIFO_EMPTY	Output	FIFOCLK	(Optional) When FIFO is enabled, this signal indicates that the FIFO is empty.
SLOWCLK	Input	-	Parallel (slow) clock.
FASTCLK	Input	-	Serial (fast) clock.
FIFOCLK	Input	-	(Optional) Core clock to read from the FIFO.
FIFO_RD	Input	FIFOCLK	(Optional) Enables FIFO to read.
RST	Input	FIFOCLK SLOWCLK	(Optional) Asynchronous. Resets the FIFO and serializer. If the FIFO is enabled, it is relative to FIFOCLK; otherwise it is relative to SLOWCLK.
ENA	Input	-	Dynamically enable or disable the LVDS input buffer. Can save power when disabled. 1: Enabled 0: Disabled
TERM	Input	-	Enables or disables termination in dynamic termination mode. 1: Enabled 0: Disabled
DLY_ENA	Input	SLOWCLK	(Optional) Enable the dynamic delay control or the DPA circuit, depending on which one is enabled.
DLY_INC	Input	SLOWCLK	(Optional) Dynamic delay control. Cannot be used with DPA enabled. When DLY_ENA is 1: 1: Increments 0: Decrements
DLY_RST	Input	SLOWCLK	(Optional) Reset the delay counter or the DPA circuit, depending on which one is enabled.

The following waveform shows the relationship between the fast clock, slow clock, RX data coming in from the pad, and byte-aligned data to the core.

Figure 25: LVDS RX Timing Example Serialization Width of 8 (Half Rate)

LVDS TX

You can configure an HSIO block as one LVDS TX signal. LVDS TX can be used in the serial data output mode or reference clock output mode.

Figure 26: LVDS TX Interface Block Diagram

Table 16: LVDS TX Signals (Interface to FPGA Fabric)

Signal	Direction	Clock Domain	Description
OUT[9:0]	Input	SLOWCLK	Parallel output data from the core. The width is programmable.
SLOWCLK	Input	-	Parallel (slow) clock.
FASTCLK	Input	-	Serial (fast) clock.
RST	Input	SLOWCLK	(Optional) Resets the serializer.
OE	Input	-	(Optional) Output enable signal.

The following waveform shows the relationship between the fast clock, slow clock, TX data going to the pad, and byte-aligned data from the core.

Figure 27: LVDS Timing Example Serialization Width of 8 (Half Rate)

OUT is byte-aligned data passed from the core on the rising edge of SLOWCLK.

LVDS Bidirectional

You can configure an HSIO block as one LVDS bidirectional signal. You must use the same serialization for the RX and TX.

Figure 28: LVDS Bidirectional Interface Block Diagram

Table 17: LVDS Bidirectional Signals (Interface to FPGA Fabric)

Signal	Direction	Clock Domain	Description
IN[9:0]	Output	SLOWCLK	Parallel input data to the core. The width is programmable.
LOCK	Output	-	(Optional) When DPA is enabled, this signal indicates that the DPA has achieved training lock and data can be passed.
FIFO_EMPTY	Output	FIFOCLK	(Optional) When the FIFO is enabled, this signal indicates that the FIFO is empty.
INSLOWCLK	Input	-	Parallel (slow) clock for RX.
INFASTCLK	Input	-	Serial (fast) clock for RX.
FIFOCLK	Input	-	(Optional) Core clock to read from the FIFO.
FIFO_RD	Input	FIFOCLK	(Optional) Enables FIFO to read.
INRST	Input	FIFOCLK SLOWCLK	(Optional) Asynchronous. Resets the FIFO and RX serializer. If the FIFO is enabled, it is relative to FIFOCLK; otherwise it is relative to SLOWCLK.
ENA	Input	-	Dynamically enable or disable the LVDS input buffer. Can save power when disabled. 1: Enabled 0: Disabled
TERM	Input	-	Enables or disables termination in dynamic termination mode. 1: Enabled 0: Disabled

Signal	Direction	Clock Domain	Description
DLY_ENA	Input	SLOWCLK	(Optional) Enable the dynamic delay control or the DPA circuit, depending on which one is enabled.
DLY_INC	Input	SLOWCLK	(Optional) Dynamic delay control. Cannot be used with DPA enabled. When DLY_ENA is 1, 1: Increments 0: Decrements
DLY_RST	Input	SLOWCLK	(Optional) Reset the delay counter or the DPA circuit, depending on which one is enabled.
OUT[9:0]	Input	SLOWCLK	Parallel output data from the core. The width is programmable.
OUTSLOWCLK	Input	-	Parallel (slow) clock for TX.
OUTFASTCLK	Input	-	Serial (fast) clock for TX.
OUTRST	Input	SLOWCLK	(Optional) Resets the TX serializer.
OE	Input	-	Output enable signal.

LVDS Pads

Table 18: LVDS Pads

Signal	Direction	Description
P	Output	Differential pad P.
N	Output	Differential pad N.

HSIO Configured as MIPI Lane

You can configure the HSIO block as a MIPI RX or TX lane. The block supports bidirectional data lane, unidirectional data lane, and unidirectional clock lane which can run at speeds up to 1.5 Gbps. The MIPI lane operates in high-speed (HS) and low-power (LP) modes. In HS mode, the HSIO block transmits or receives data with x8 serializer/deserializer. In LP mode, it transmits or receives data without deserializer/serializer.

The MIPI lane block does not include the MIPI D-PHY core logic. A full MIPI D-PHY solution requires:

- Multiple MIPI RX or TX lanes (at least a clock lane and a data lane)
- Soft MIPI D-PHY IP core programmed into the FPGA fabric

The MIPI D-PHY standard is a point-to-point protocol with one endpoint (TX) responsible for initiating and controlling communication. Often, the standard is unidirectional, but when implementing the MIPI DSI protocol, you can use one TX data lane for LP bidirectional communication.

The protocol is source synchronous with one clock lane and 1, 2, 4, or 8 data lanes. The number of lanes available depends on which package you are using. A dedicated HSIO block is assigned on the RX interface as a clock lane while the clock lane for TX interface can use any of the HSIO block in the group.

MIPI RX Lane

In RX mode, the HS (fast) clock comes in on the MIPI clock lane and is divided down to generate the slow clock. The fast and slow clocks are then passed to neighboring HSIO blocks to be used for the MIPI data lanes.

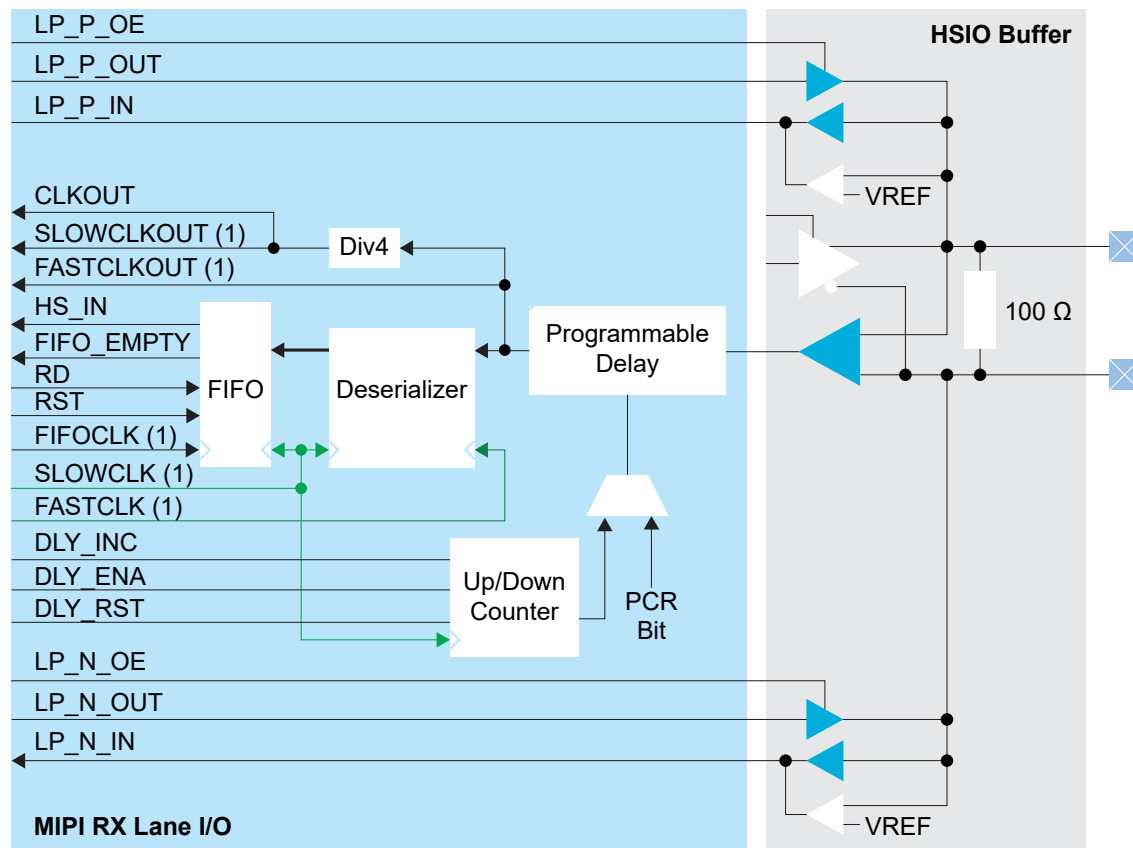

The data lane fast and slow clocks must be driven by a clock lane in the same MIPI group (dedicated buses drive from the clock lane to the neighboring data lanes).

The MIPI RX function is defined as:

Table 19: MIPI RX Function

MIPI RX Function	Description
RX_DATA_xy_zz	MIPI RX Lane. You can use any data lanes within the same group to form multiple lanes of MIPI RX group. x = P or N y = 0 to 7 data lanes (Up to 8 data lanes) zz = I0 to I11 MIPI RX group (Up to 12 MIPI RX groups)
RX_CLK_x_zz	MIPI RX Clock Lane. x = P or N zz = I0 to I11 MIPI RX group (Up to 12 MIPI RX groups)

Figure 29: MIPI RX Lane Block Diagram

1. These signals are in the primitive, but the software automatically connects them for you.

Table 20: MIPI RX Lane Signals

Interface to MIPI soft CSI/DSI controller with D-PHY in FPGA Fabric

Signal	Direction	Clock Domain	Description
HS_IN[7:0]	Output	SLOWCLK	High-speed parallel data input.
LP_P_IN	Output	-	LP input data from the P pad.
LP_N_IN	Output	-	LP input data from the N pad.
LP_P_OUT	Input	-	(Optional) LP output data from the core for the P pad. Used if the data lane is reversible.
LP_N_OUT	Input	-	(Optional) LP output data from the core for the N pad. Used if the data lane is reversible.
FIFO_EMPTY	Output	FIFOCLK	(Optional) When the FIFO is enabled, this signal indicates that the FIFO is empty.
SLOWCLKOUT ⁽⁴⁾	Output	-	Divided down parallel (slow) clock from the pads. Can only drive RX DATA lanes.
FASTCLKOUT ⁽⁴⁾	Output	-	Serial (fast) clock from the pads. Can only drive RX DATA lanes.
CLKOUT	Output	-	Divided down parallel (slow) clock from the pads that can drive the core clock tree. Used to drive the core logic implementing the rest of the D-PHY protocol. It should also connect to the FIFOCLK of the data lanes.
SLOWCLK ⁽⁴⁾	Input	-	Parallel (slow) clock.
FASTCLK ⁽⁴⁾	Input	-	Serial (fast) clock.
FIFOCLK ⁽⁴⁾	Input	-	(Optional) Core clock to read from the FIFO.
FIFO_RD	Input	FIFOCLK	(Optional) Enables FIFO to read.
RST	Input	FIFOCLK SLOWCLK	(Optional) Asynchronous. Resets the FIFO and serializer. If the FIFO is enabled, it is relative to FIFOCLK; otherwise it is relative to SLOWCLK.
HS_ENA	Input	-	Dynamically enable the differential input buffer when in high-speed mode.
HS_TERM	Input	-	Dynamically enables input termination high-speed mode.
DLY_ENA	Input	SLOWCLK	(Optional) Enable the dynamic delay control.
DLY_INC	Input	SLOWCLK	(Optional) Dynamic delay control. When DLY_ENA is 1, 1: Increments 0: Decrements
DLY_RST	Input	SLOWCLK	(Optional) Reset the delay counter.

⁽⁴⁾ These signals are in the primitive, but the software automatically connects them for you.

The clock lane generates the fast clock and slow clock for the RX data lanes within the interface group. It also generates a clock that feeds the global network. The following figure shows the clock connections between the clock and data lanes.

Figure 30: Connections for Clock and RX Data Lane in the Same MIPI RX Group

1. The software automatically connects this signal for you.

MIPI TX Lane

In TX mode, a PLL generates the parallel and serial clocks and passes them to the clock and data lanes.

Figure 31: MIPI TX Lane Block Diagram

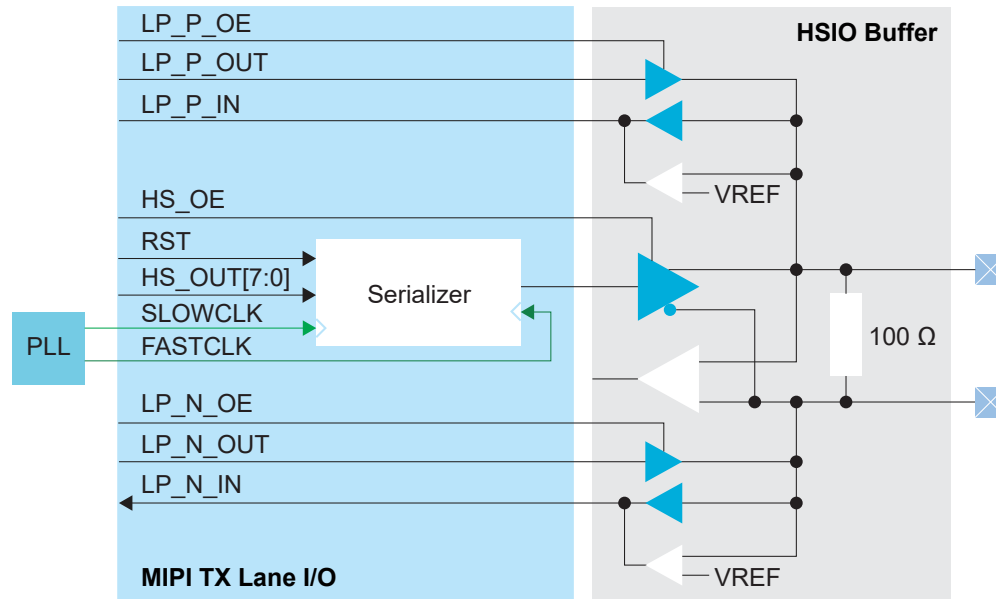

Table 21: MIPI TX Lane Signals

Interface to MIPI soft CSI/DSI controller with D-PHY in FPGA fabric

Signal	Direction	Clock Domain	Description
HS_OUT[7:0]	Input	SLOWCLK	High-speed output data from the core. Always 8-bits wide.
LP_P_OUT	Input	-	LP output data from the core for the P pad.
LP_N_OUT	Input	-	LP output data from the core for the N pad.
LP_P_IN	Output	-	(Optional) LP input data from the P pad. Used if data lane is reversible.
LP_N_IN	Output	-	(Optional) LP input data from the N pad. Used if data lane is reversible.
SLOWCLK	Input	-	Parallel (slow) clock.
FASTCLK	Input	-	Serial (fast) clock.
RST	Input	SLOWCLK	(Optional) Resets the serializer.
HS_OE	Input	-	High-speed output enable signal.
LP_P_OE	Input	-	LP output enable signal for P pad.
LP_N_OE	Input	-	LP output enable signal for N pad.

MIPI Lane Pads

Table 22: MIPI Lane Pads

Signal	Direction	Description
P	Output	Differential pad P.
N	Output	Differential pad N.

I/O Banks

Efnix FPGAs have input/output (I/O) banks for general-purpose usage. Each I/O bank has independent power pins. The number and voltages supported vary by FPGA and package.

Some I/O banks are merged at the package level by sharing VCCIO pins, these are called merged banks. Merged banks have underscores () between banks in the VCCIO name (e.g., 1B_1C means VCCIO for bank 1B and 1C are connected). Some of the banks in a merged bank may not have available user I/Os in the package. The following table lists banks that have available user I/Os in a package.

Table 23: I/O Banks by Package

Package	I/O Banks	Voltage (V)	Dynamic Voltage Support	DDIO Support	Merged Banks
W64	1A, 1B, 3B	1.2, 1.5, 1.8	-	All	1A_4B, 1B_2A, 2A_3A_3B_4A
F100S3F2	1A, 2A	1.2, 1.5, 1.8 ⁽⁵⁾	-	All	1A_4B, 2A_2B
	1B, 3A, 3B	1.2, 1.5, 1.8	-	All	3B_4A
	BL	1.8, 2.5, 3.0, 3.3	✓	All	-
F225	BL, TL, TR, BR,	1.8, 2.5, 3.0, 3.3	✓	All	-
	1A, 1B, 2A, 2B, 3A, 3B, 4A, 4B	1.2, 1.5, 1.8	-	All	-

Learn more: Refer to the [Ti35 Pinout \(.xlsx\)](#) for information on the I/O bank assignments.

Oscillator

The Ti35 has one low-frequency oscillator tailored for low-power operation. The oscillator runs at a nominal frequency of 10, 20, 40, or 80 MHz. You can use the oscillator to perform always-on functions with the lowest power possible. Its output clock is available to the core. You can enable or disable the oscillator to allow power savings when not in use.

⁽⁵⁾ The SPI flash memory's VCC is connected to VCCIO1A_4B. If you are using the SPI flash memory, drive the VCCIO1A_4B with a 1.8 V supply.

PLL

Titanium FPGAs have 4 PLLs to synthesize clock frequencies. The PLLs are located in the corners of the FPGA. You can use the PLL to compensate for clock skew/delay via external or internal feedback to meet timing requirements in advanced applications. The PLL reference clock has up to four sources. You can dynamically select the PLL reference clock with the CLKSEL port. (Hold the PLL in reset when dynamically selecting the reference clock source.)

The PLL consists of a pre-divider counter (N counter), a feedback multiplier counter (M counter), a post-divider counter (O counter), and output dividers (C).

Note: You can cascade the PLLs in Ti35 FPGAs. To avoid the PLL losing lock, Efinix recommends that you do not cascade more than two PLLs.

Figure 32: PLL Block Diagram

The counter settings define the PLL output frequency:

Local and Core Feedback Mode	Where:
$F_{PFD} = F_{IN} / N$ $F_{VCO} = (F_{PFD} \times M \times O \times C_{FBK})^{(6)}$ $F_{PLL} = F_{VCO} / O$ $F_{OUT} = (F_{IN} \times M \times C_{FBK}) / (N \times C)$	F_{VCO} is the voltage control oscillator frequency F_{PLL} is the post-divider PLL VCO frequency F_{OUT} is the output clock frequency F_{IN} is the reference clock frequency F_{PFD} is the phase frequency detector input frequency O is the post-divider counter C is the output divider

⁽⁶⁾ $(M \times O \times C_{FBK})$ must be ≤ 255 .

Note: Refer to the [PLL Timing and AC Characteristics](#) on page 63 for F_{VCO} , F_{OUT} , F_{IN} , F_{PLL} , and F_{PFD} values.

Figure 33: PLL Interface Block Diagram

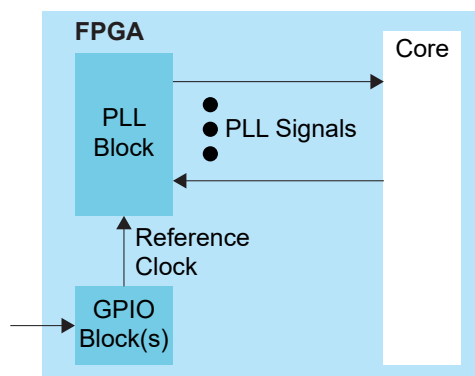

Table 24: PLL Signals (Interface to FPGA Fabric)

Signal	Direction	Description
CLKIN[3:0]	Input	Reference clocks driven by I/O pads or core clock tree.
CLKSEL[1:0]	Input	You can dynamically select the reference clock from one of the clock in pins.
RSTN	Input	Active-low PLL reset signal. When asserted, this signal resets the PLL; when de-asserted, it enables the PLL. Connect this signal in your design to power up or reset the PLL. Assert the RSTN pin for a minimum pulse of 10 ns to reset the PLL. Assert RSTN when dynamically changing the selected PLL reference clock.
FBK	Input	Connect to a clock out interface pin when the PLL is in core feedback mode.
IOFBK	Input	Connect to a clock out interface pin when the PLL is in external I/O feedback mode.
CLKOUT0 CLKOUT1 CLKOUT2 CLKOUT3 CLKOUT4	Output	PLL output. You can route these signals as input clocks to the core's GCLK network. CLKOUT4 can only feed the top or bottom regional clocks. All PLL outputs lock on the negative clock edge. The Interface Designer inverts the clock polarity on the leaf cells by default (Invert Output Clock option unchecked). You can use CLKOUT0 only for clocks with a maximum frequency of 4x (integer) of the reference clock. If all your system clocks do not fall within this range, you should dedicate one unused clock for CLKOUT0.
LOCKED	Output	Goes high when PLL achieves lock; goes low when a loss of lock is detected. Connect this signal in your design to monitor the lock status.
SHIFT[2:0]	Input	(Optional) Dynamically change the phase shift of the output selected to the value set with this signal. Possible values from 000 (no phase shift) to 111 (3.5 F_{PLL} cycle delay). Each increment adds 0.5 cycle delay.
SHIFT_SEL[4:0]	Input	(Optional) Choose the output(s) affected by the dynamic phase shift.
SHIFT_ENA	Input	(Optional) When high, changes the phase shift of the selected PLL(s) to the new value.

Table 25: PLL Reference Clock Resource Assignments (F100S3F2)

PLL	REFCLK0	REFCLK1	REFCLK2	External Feedback I/O
PLL_TL	Single-ended: GPIOL_P_18_PLLIN0 Differential: GPIOL_P_18_PLLIN0, GPIOL_N_18	Unbonded ⁽⁷⁾	Unbonded ⁽⁷⁾	Single-ended: GPIOL_P_17_EXTFB Differential: GPIOL_P_17_EXTFB, GPIOL_N_17
PLL_TR	Single-ended: GPIOR_P_19_PLLIN0 Differential: GPIOR_P_19_PLLIN0, GPIOR_N_19	Unbonded ⁽⁷⁾	Unbonded ⁽⁷⁾	Unbonded ⁽⁷⁾

Table 26: PLL Reference Clock Resource Assignments (F225)

PLL	REFCLK0	REFCLK1	REFCLK2	External Feedback I/O
PLL_BL	Single-ended: GPIOL_P_00_PLLIN0 Differential: GPIOL_P_00_PLLIN0, GPIOL_N_00	Single-ended: GPIOB_P_00_PLLIN1 Differential: GPIOB_P_00_PLLIN1, GPIOB_N_00	Unbonded ⁽⁷⁾	Single-ended: GPIOB_P_01_EXTFB Differential: GPIOB_P_01_EXTFB, GPIOB_N_01
PLL_TL	Single-ended: GPIOL_P_18_PLLIN0 Differential: GPIOL_P_18_PLLIN0, GPIOL_N_18	Single-ended: GPIOT_P_00_PLLIN1 Differential: GPIOT_P_00_PLLIN1, GPIOT_N_00	GPIOL_11_PLLIN2	Single-ended: GPIOL_P_17_EXTFB Differential: GPIOL_P_17_EXTFB, GPIOL_N_17
PLL_TR	Single-ended: GPIOR_P_19_PLLIN0 Differential: GPIOR_P_19_PLLIN0, GPIOR_N_19	Single-ended: GPIOT_P_17_PLLIN1 Differential: GPIOT_P_17_PLLIN1, GPIOT_N_17	Unbonded ⁽⁷⁾	Single-ended: GPIOT_P_16_EXTFB Differential: GPIOT_P_16_EXTFB, GPIOT_N_16
PLL_BR	Single-ended: GPIOR_P_00_PLLIN0 Differential: GPIOR_P_00_PLLIN0, GPIOR_N_00_CDI22	Single-ended: GPIOB_P_17_PLLIN1 Differential: GPIOB_P_17_PLLIN1, GPIOB_N_17	GPIOR_29_PLLIN2	Single-ended: GPIOR_P_01_EXTFB Differential: GPIOR_P_01_EXTFB, GPIOR_N_01_CDI23

⁽⁷⁾ There is no dedicated pin assigned to this reference clock.

Dynamic Phase Shift

Ti35 FPGAs support a dynamic phase shift where you can adjust the phase shift of each output dynamically in user mode by up to 3.5 F_{PLL} cycles. For example, to phase shift a 400 MHz clock by 90-degree, configure the PLL to have a F_{PLL} frequency of 800 MHz, set the output counter division to 2, and set $SHIFT[2:0]$ to 001.

Implementing Dynamic Phase Shift

Use these steps to implement the dynamic phase shift:

1. Write the new phase setting into $SHIFT[2:0]$.
2. After 1 clock cycle of the targeted output clock that you want to shift, assert the $SHIFT_SEL[n]$ and $SHIFT_ENA$ signals.
3. Hold $SHIFT_ENA$ and $SHIFT_SEL[n]$ high for a minimum period of 4 clock cycles of the targeted output clock.
4. De-assert $SHIFT_ENA$ and $SHIFT_SEL[n]$. Wait for at least 4 clock cycles of the targeted output clock before asserting $SHIFT_ENA$ and $SHIFT_SEL[n]$ again.

Note: n in $SHIFT_SEL[n]$ represents the output clock that you intend to add phase shift.

The following waveforms describe the signals for a single phase shift and consecutive multiple phase shifts.

Figure 34: Single Dynamic Phase Shift Waveform Example for CLKOUT1

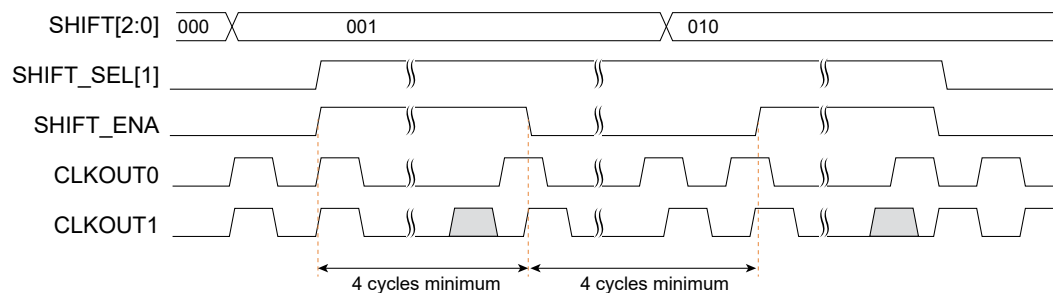

Figure 35: Consecutive Dynamic Phase Shift Waveform Example for CLKOUT1

SPI Flash Memory

Ti35 FPGAs in the F100S3F2 package include a SPI flash memory. The SPI flash memory has a density of 16 Mbits and a clock rate of up to 85 MHz. In active configuration mode, the FPGA is configured using the configuration bitstream in the SPI flash memory. Typically you can fit two compressed bitstream images into the F100S3F2 SPI flash.

Important: You cannot enable the Ti35 FPGA security features when using compressed bitstreams.

To use active programming mode for the Ti35 F100S3F2 with the SPI flash memory, you must use the SPI Active using JTAG Bridge configuration mode to configure the SPI flash memory.

Learn more: Refer to the [AN 033: Configuring Titanium FPGAs](#) for information on programming the SPI flash memory.

Figure 36: SPI Flash Memory Block Diagram

Important: The SPI flash memory's VCC is connected to VCCIO1A_4B. If you are using the SPI flash memory, drive the VCCIO1A_4B with a 1.8 V supply.

Table 27: SPI Flash Memory Signals (Interface to FPGA Fabric)

Signal	Direction	Description
SCLK	Input	Clock output to SPI flash memory.
MOSI	Input	Data output to SPI flash memory.
CS_N	Input	Active-low SPI flash memory chip select.
WP_N	Input	Active-low write protect signal.
HOLD_N	Input	Active-low hold signal.
MISO	Output	Data input from SPI flash memory.

Important: Pins GPIOL_P_01, GPIOL_N_01, GPIOL_P_03, and GPIOL_N_03 are not available as user I/Os if you enable the SPI flash memory access during user mode. Refer to the [Titanium Interfaces User Guide](#) for information about enabling the SPI flash memory during user mode to store user data.

HyperRAM

The Ti35 FPGA in F100S3F2 package includes a HyperRAM. The HyperRAM has a density of 256 Mbits and a clock rate of up to 200 MHz. The HyperRAM supports double-data rates of up to 400 Mbps and supports a 16 bit data bus.

Figure 37: HyperRAM Block Diagram

Important: The HyperRAM's VCC is connected to VCCIO_2A_2B. If you are using the HyperRAM, drive the VCCIO_2A_2B with a 1.8 V supply.

Table 28: HyperRAM Signals (Interface to FPGA Fabric)

Signal	Direction	Description
CLK	Input	HyperRAM controller clock.
CLK90	Input	90 degree phase-shifted version of CLK.
CLKCAL	Input	Calibration clock for input data.
RST_N	Input	Active-low HyperRAM reset.
CS_N	Input	Active-low HyperRAM chip select signal.
CK_P_HI	Input	The clock provided to the HyperRAM. The clock is not required to be free-running. Registered in normal mode of DDIO.
CK_P_LO	Input	
CK_N_HI	Input	
CK_N_LO	Input	
RWDS_OUT_HI [1:0]	Input	Read/write data strobe input ports for data mask during write operation. Registered in normal mode/resync mode of DDIO.
RWDS_OUT_LO [1:0]	Input	
RWDS_OE [1:0]	Input	Read/write data strobe output enable port.
RWDS_IN_HI [1:0]	Output	Read/write data strobe output ports for latency indication, also center-aligned reference strobe for read data. Registered in normal mode/resync mode of DDIO.
RWDS_IN_LO [1:0]	Output	
DQ_OUT_HI [15:0]	Input	DQ input ports for command, address and data. Registered in normal mode of DDIO.
DQ_OUT_LO [15:0]	Input	
DQ_OE [15:0]	Input	DQ output enable port.
DQ_IN_HI [15:0]	Output	DQ output ports for data.
DQ_IN_LO [15:0]	Output	

Single-Event Upset Detection

The Ti35 FPGA has a hard block for detecting single-event upset (SEU). The SEU detection feature has two modes:

- *Auto mode*—The Ti35 control block periodically runs SEU error checks and flags if it detects an error. You can configure the interval time between SEU checks.
- *Manual mode*—The user design runs the check.

In both modes, the user design is responsible for deciding whether to reconfigure the Ti35 when an error is detected.

Learn more: For more information on using the SEU detection feature, refer to the [Titanium Interfaces User Guide](#).

Internal Reconfiguration Block

The Ti35 FPGAs have built-in hardware that supports an internal reconfiguration feature. The Ti35 can reconfigure itself from a bitstream image stored in flash memory.

Security Feature

The Ti35 FPGA security feature includes:

- Intellectual property protection using bitstream encryption with the AES-GCM-256 algorithm
- Anti-tampering support using asymmetric bitstream authentication with the RSA-4096 algorithm

Important: You cannot enable the Ti35 FPGA security features when using compressed bitstreams.

You can enable encryption, authentication, or both. You enable the security features at the project level.

Figure 38: Security Flow

Download: Refer to the Securing Titanium Bitstreams section of the Configuring an FPGA chapter in the [Efinity Software User Guide](#) for instructions on how to enable these features.

Bitstream Encryption

Symmetric bitstream encryption uses a 256-bit key and the AES-GCM-256 algorithm. You create the key and then use it to encrypt the bitstream. You also need to store the key into the FPGA's fuses. During configuration, the Ti35 built-in AES-GCM-256 engine decrypts the encrypted configuration bitstream using the stored key. Without the correct key, the bitstream decryption process cannot recover the original bitstream.

Bitstream Authentication

For bitstream authentication, you use a public/private key pair and the RSA-4096 algorithm. You create a public/private key pair and sign the bitstream with the private key. Then, you save a hashed version of the public key into fuses in the FPGA. During configuration, the FPGA validates the signature on the bitstream using the public key.

If the signature is valid, the FPGA knows that the bitstream came from a trusted source and has not been altered by a third party. The FPGA continues configuring normally and goes into user mode. If the signature is invalid, the FPGA stops configuration and does not go into user mode.

The private key remains on your computer and is not shared with anyone. The FPGA only has the public key: the bitstream contains the public key data and a signature, while the fuses contain a hashed public key. You can only sign the bitstream with the private key. An attacker cannot re-sign a tampered bitstream without the private key.

Disabling JTAG Access

Ti35 FPGA's support JTAG blocking, which disables JTAG access to the FPGA by blowing a fuse. Once the fuse is blown, you cannot perform any JTAG operation except for reading the FPGA IDCODE, reading `DEVICE_STATUS`, and enabling `BYPASS` mode. To fully secure the FPGA, you **must** blow the JTAG fuse.

Important: Once you blow the fuse, however, you cannot use JTAG ever again in that FPGA (except for `IDCODE`, `DEVICE_STATUS`, and `BYPASS`). So blowing this fuse should be the very last step in your manufacturing process.

Power Up Sequence

You **must** use the following power up sequence when powering Titanium FPGAs:

1. Power up VCC and VCCA_XX first.
2. When VCC and VCCA_XX are stable, power up all VCCIO and VCCAUX. There is no specific timing delay between the VCCIO pins.

Important: Ensure the power ramp rate is within VCCIO/10 V/ms to 10 V/ms.

3. After all power supplies are stable, hold CRESET_N low for a duration of $t_{\text{CRESET_N}}$ before asserting CRESET_N from low to high to trigger active SPI programming (the FPGA loads the configuration data from an external flash device).

Figure 39: Power Up Sequence

Learn more: Refer to [AN 030: Using the Titanium Power Estimator](#) for detailed information on FPGA power estimation.

Note: Refer to [Configuration Timing](#) on page 64 for timing information.

Table 29: Connection Requirements for Unused Resources and Features

Unused Resource/Feature	Pin	Note
PLL	VCCA_XX	Connect to VCC.
HSIO Bank	VCCIO_XX	Connect to either 1.2 V, 1.5 V, or 1.8 V.
HVIO Bank	VCCIO33_XX	Connect to either 1.8 V, 2.5 V, 3.0 V, or 3.3 V.

Learn more: Refer to [Titanium Hardware Design Checklist and Guidelines](#) for connection requirements for unused resources.

Power Supply Current Transient

You may observe an inrush current on the dedicated power rail during power-up. You must ensure that the power supplies selected in your board meets the current requirement during power-up and the estimated current during user mode. Use the Power Estimator to calculate the estimated current during user mode.

Table 30: Minimum Power Supply Current Transient

Power Supply	Minimum Power Supply Current Transient	Unit
VCC	500	mA

Configuration

The Ti35 FPGA contains volatile Configuration RAM (CRAM). The user must configure the CRAM for the desired logic function upon power-up and before the FPGA enters normal operation. The FPGA's control block manages the configuration process and uses a bitstream to program the CRAM. The Efinity[®] software generates the bitstream, which is design dependent. You can configure the Ti35 FPGA(s) in SPI active, SPI passive, or JTAG mode.

Figure 40: High-Level Configuration Options

In active mode, the FPGA controls the configuration process. The configuration clock can either be provided by an oscillator circuit within the FPGA or an external clock connected to the EXT_CONFIG_CLK pin. The bitstream is typically stored in an external serial flash device, which provides the bitstream when the FPGA requests it.

The control block sends out the instruction and address to read the configuration data. First, it issues a release from power-down instruction to wake up the external SPI flash. Then, it waits for at least 30 μ s before issuing a fast read command to read the content of SPI flash from address 24h'000000.

In passive mode, the FPGA is the slave and relies on an external master to provide the control, bitstream, and clock for configuration. Typically the master is a microcontroller or another FPGA in active mode. The controller must wait for at least 32 μ s after CRESET is deasserted before it can send the bitstream.

In JTAG mode, you configure the FPGA via the JTAG interface.

Supported FPGA Configuration Modes

Table 31: Ti35 Configuration Modes by Package

Configuration Mode	Width	F100S3F2	F225
Active	X1	✓	✓
	X2	✓	✓
	X4	-	✓
	X8	-	✓
Passive	X1	✓	✓
	X2	✓	✓
	X4	-	✓
	X8	-	✓
	X16	-	✓ ⁽⁸⁾
	X32	-	✓ ⁽⁸⁾
JTAG	X1	✓	✓

Learn more: Refer to [AN 033: Configuring Titanium FPGAs](#) for more information.

⁽⁸⁾ Not supported when security mode is enabled.

Characteristics and Timing

DC and Switching Characteristics

Important: All specifications are preliminary and pending hardware characterization.

Table 32: Absolute Maximum Ratings

Conditions beyond those listed may cause permanent damage to the device. Device operation at the absolute maximum ratings for extended periods of time has adverse effects on the device.

Symbol	Description	Min	Max	Units
VCC	Core power supply	-0.5	1.05	V
VCCA	PLL analog power supply	-0.5	1.05	V
VCCAUX	1.8 V auxiliary power supply	-0.5	1.98	V
VCCIO	HSIO bank power supply	-0.5	1.98	V
VCCIO33	HVIO bank power supply	-0.5	3.6	V
I _{IN}	Maximum current allowed through any I/O pin when the devices is not turned on or during power-up/down ⁽¹⁰⁾	-	10	mA
V _{IN}	HVIO input voltage	-0.5	3.63	V
	HSIO input voltage	-0.5	1.98	V
T _J	Operating junction temperature	-40	125	°C
T _{STG}	Storage temperature, ambient	-55	150	°C

⁽⁹⁾ Supply voltage specification applied to the voltage taken at the device pins with respect to ground, not at the power supply.

⁽¹⁰⁾ Should not exceed a total of 100 mA per bank

Table 33: Recommended Operating Conditions (C3, C4, I3 Speed Grades)⁽⁹⁾

Symbol	Description	Min	Typ	Max	Units
VCC	Core power supply	0.92	0.95	0.98	V

HSIO Electrical and Timing Specifications

The HSIO pins comply with the LVDS EIA/TIA-644 electrical specifications.

Important: All specifications are preliminary and pending hardware characterization.

HSIO as LVDS, Sub-LVDS, Bus-LVDS, RSDS, Mini LVDS, and SLVS

Table 51: HSIO Electrical Specifications when Configured as LVDS

Parameter	Description	Test Conditions	Min	Typ	Max	Unit
LVDS TX						
V _{CCIO}	LVDS transmitter voltage supply	-	1.71	1.8	1.89	V
V _{OD}	Output differential voltage	RL = 100 Ω	200	350	450	mV
Δ V _{OD}	Change in V _{OD}	-	-	-	50	mV
V _{OCM}	Output common mode voltage	-	1.125	1.2	1.375	V
Δ V _{OCM}	Change in V _{OCM}	-	-	-	50	mV
LVDS RX						
V _{ID}	Input differential voltage	-	100	-	600	mV
V _{ICM}	Input common mode voltage (f _{max} ≤ 1000 Mbps)	-	100	-	1,600	mV
	Input common mode voltage (f _{max} > 1000 Mbps)	-	700	-	1,400	mV
V _i	Input voltage valid range	-	0	-	1.89	V

Table 52: HSIO Timing Specifications when Configured as LVDS

Parameter	Description	Min	Typ	Max	Unit
t _{LVDS_DT}	LVDS TX reference clock output duty cycle	45	50	55	%
t _{LVDS_skew}	LVDS TX lane-to-lane skew	-	200	-	ps

Table 53: HSIO Electrical Specifications when Configured as Sub-LVDS

Parameter	Description	Test Conditions	Min	Typ	Max	Unit
Sub-LVDS TX						
VCCIO	Sub-LVDS transmitter voltage supply	-	1.71	1.8	1.89	V
V _{OD}	Output differential voltage	RL = 100 Ω	100	150	200	mV
ΔV _{OD}	Change in V _{OD}	-	-	-	50	mV
V _{OCM}	Output common mode voltage	-	0.8	0.9	1.0	V
ΔV _{OCM}	Change in V _{OCM}	-	-	-	50	mV
Sub-LVDS RX						
V _{ID}	Input differential voltage	-	100	-	600	mV
V _{ICM}	Input common mode voltage	-	100	-	1600	mV
V _i	Input voltage valid range	-	0	-	1.89	V

Table 54: HSIO Electrical Specifications when Configured as Bus-LVDS

Parameter	Description	Test Conditions	Min	Typ	Max	Unit
Bus-LVDS TX						
VCCIO	Voltage supply for LVDS transmitter	-	1.71	1.8	1.89	V
V _{OD}	Differential output voltage	RL = 27 Ω	200	250	300	mV
ΔV _{OD}	Static difference of V _{OD} (between 0 and 1)	-	-	-	50	mV
V _{OC}	Output common mode voltage	-	1.125	1.2	1.375	V
ΔV _{OC}	Output common mode voltage offset	-	-	-	50	mV
Bus-LVDS RX						
V _{ID}	Differential input voltage	-	100	-	600	mV
V _{IC}	Differential input common mode	-	100	-	1600	mV
V _i	Valid input voltage range	-	0	-	1.89	V

Table 55: HSIO Electrical Specifications when Configured as RSDS, Mini LVDS and SLVS

IO standard	V _{ID} (mV)		V _{ICM} (mV)		V _{OD} (mV)			V _{OCM} (mV)		
	Min	Max	Min	Max	Min	Typ	Max	Min	Typ	Max
RSDS	100	-	300	1400	100	200	600	500	1200	1400
Mini LVDS	200	600	400	1325	250	-	600	1000	1200	1400
SLVS	100	400	100	300	150	200	250	140	200	270

HSIO as High-Speed and Low-Power MIPI Lane

The MIPI transmitter and receiver lanes are compliant to the MIPI Alliance Specification for D-PHY Revision 1.1.

Table 56: HSIO DC Specifications when Configured as High-Speed MIPI TX Lane

Parameter	Description	Min	Typ	Max	Unit
VCCIO	High-speed transmitter voltage supply	1.14	1.2	1.26	V
V _{CMTX}	High-speed transmit static common-mode voltage	150	200	250	mV
ΔV_{CMTX}	V _{CMTX} mismatch when output is Differential-1 or Differential-0	-	-	5	mV
V _{OD}	High-speed transmit differential voltage	140	200	270	mV
ΔV_{OD}	V _{OD} mismatch when output is Differential-1 or Differential-0	-	-	14	mV
V _{OHHS}	High-speed output high voltage	-	-	360	mV
V _{CMRX}	Common mode voltage for high-speed receive mode	70	-	330	mV

Table 57: HSIO DC Specifications when Configured as Low-Power MIPI TX Lane

Parameter	Description	Min	Typ	Max	Unit
V _{OH}	Thevenin output high level	1.1	1.2	1.3	V
V _{OL}	Thevenin output low level	-50	-	50	mV
Z _{OLP}	Output impedance of low-power transmitter	110	-	-	Ω

Table 58: HSIO DC Specifications when Configured as High-Speed MIPI RX Lane

Parameter	Description	Min	Typ	Max	Unit
V _{CMRX(DC)}	Common mode voltage high-speed receiver mode	70	-	330	mV
V _{IDTH}	Differential input high threshold	-	-	70	mV
V _{IDTL}	Differential input low threshold	-70	-	-	mV
V _{IHHS}	Single-ended input high voltage	-	-	460	mV
V _{ILHS}	Single-ended input low voltage	-40	-	-	mV

Table 59: HSIO DC Specifications when Configured as Low-Power MIPI RX Lane

Parameter	Description	Min	Typ	Max	Unit
V _{IH}	Logic 1 input voltage	880	-	-	mV
V _{IL}	Logic 0 input voltage, not in ULP state	-	-	550	mV
V _{IL-ULPS}	Logic 0 input voltage, ULPS state	-	-	300	mV
V _{HYST}	Input hysteresis	25	-	-	mV

PLL Timing and AC Characteristics

The following tables describe the PLL timing and AC characteristics.

Important: All specifications are preliminary and pending hardware characterization.

Table 60: PLL Timing

Symbol	Parameter	Min	Typ	Max	Units
F_{IN}	Input clock frequency.	16	-	800	MHz
F_{OUT}	Output clock frequency.	0.1342	-	1,000	MHz
F_{VCO}	PLL VCO frequency.	2,200	-	5,500	MHz
F_{PLL}	Post-divider PLL VCO frequency.	-	-	4,000	MHz
F_{PFD}	Phase frequency detector input frequency.	16	-	800	MHz

Table 61: PLL AC Characteristics⁽¹¹⁾

Symbol	Parameter	Min	Typ	Max	Units
t_{DT}	Output clock duty cycle.	45	50	55	%
$t_{OPJIT} (PK - PK)$ (12)	Output clock period jitter (PK-PK).	-	-	200	ps
$t_{OPJITN} (PK - PK)$ ⁽¹³⁾⁽¹⁴⁾	Output clock period jitter (PK-PK) with noisy input.	-	-	400	ps
t_{INDT}	Input clock duty cycle.	45	-	55	%
t_{LOCK}	PLL lock-in time.	-	300	500	PFD ⁽¹⁵⁾

⁽¹¹⁾ Test conditions at nominal voltage and room temperature.

⁽¹²⁾ The output jitter specification applies to the PLL jitter when an input jitter of 20 ps is applied.

⁽¹³⁾ The output jitter specification applies to the PLL jitter with maximum allowed input jitter of 800 ps.

⁽¹⁴⁾ The period jitter is measured over 10,000 sample size with minimal core and I/O activity.

⁽¹⁵⁾ PFD cycle equals to reference clock division divided by reference clock frequency.

Configuration Timing

Important: All specifications are preliminary and pending hardware characterization.

The Ti35 FPGA has the following configuration timing specifications.

Note: Refer to [AN 033: Configuring Titanium FPGAs](#) for detailed configuration information.

Timing Waveforms

Figure 41: SPI Active Mode (x1) Timing Sequence

Figure 42: SPI Passive Mode (x1) Timing Sequence

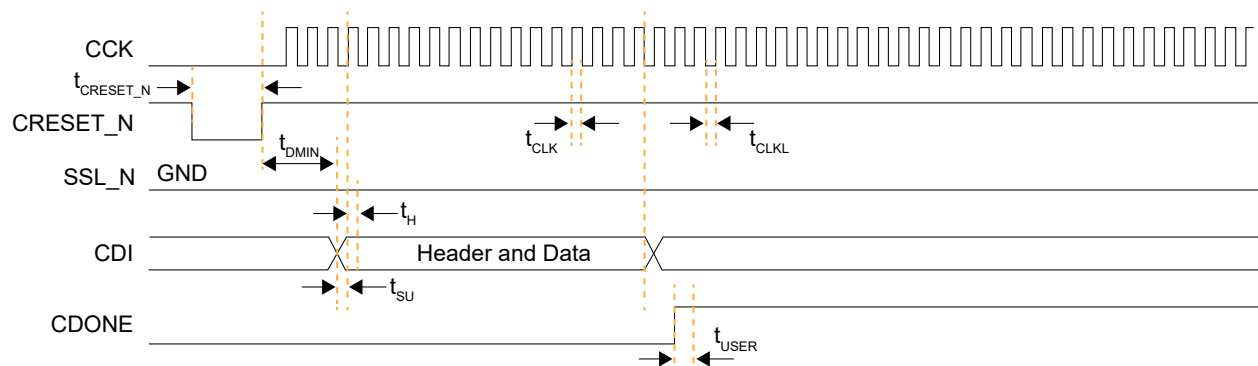

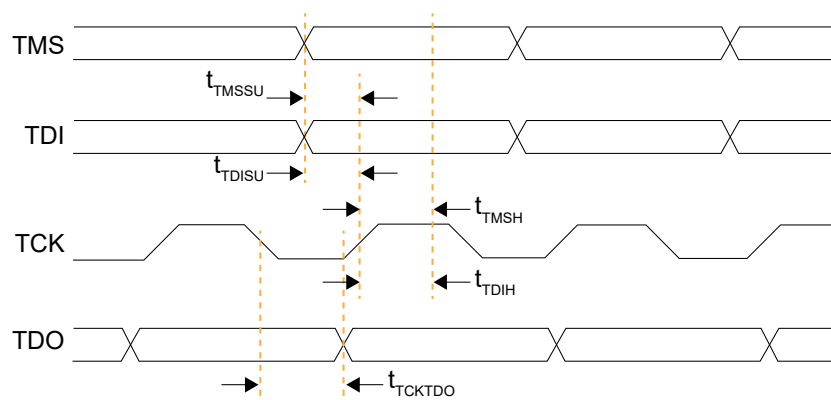

Figure 43: JTAG Timing Waveform

Timing Parameters

Table 62: All Modes

Symbol	Parameter	Min	Typ	Max	Units
t _{CRESET_N}	Minimum CRESET_N low pulse width required to trigger re-configuration.	0.32	-	-	μs
t _{USER}	Minimum configuration duration after CDONE goes high before entering user mode. ⁽¹⁶⁾⁽¹⁷⁾ Test condition at 10 kΩ pull-up resistance and 10 pF output loading on CDONE pin.	25	-	-	μs

Table 63: Active Mode

Symbol	Parameter	Frequency	Min	Typ	Max	Units
f _{MAX_M}	Active mode internal configuration clock frequency.	DIV1	52	80	100	MHz
		DIV2	26	40	52	MHz
		DIV4	13	20	26	MHz
		DIV8	6.5	10	13	MHz
f _{MAX_M_EXTCLK}	Active mode external configuration clock frequency.	-	-	-	100	MHz
t _{SU}	Setup time. Test condition at 1.8 V I/O standard and 0 pF output loading.	-	3	-	-	ns
t _H	Hold time. Test condition at 1.8 V I/O standard and 0 pF output loading.	-	0	-	-	ns

Table 64: Passive Mode

Symbol	Parameter	Min	Typ	Max	Units
f _{MAX_S}	Passive mode configuration clock frequency.	-	-	100	MHz
t _{CLKH}	Configuration clock pulse width high.	4.8	-	-	ns
t _{CLKL}	Configuration clock pulse width low.	4.8	-	-	ns
t _{SU}	Setup time.	2	-	-	ns
t _H	Hold time.	1	-	-	ns
t _{DMIN}	Minimum time between deassertion of CRESET_N to first valid configuration data.	32	-	-	μs

⁽¹⁶⁾ The FPGA may go into user mode before t_{USER} has elapsed. However, Efinix recommends that you keep the system interface to the FPGA in reset until t_{USER} has elapsed.

⁽¹⁷⁾ For JTAG programming, the min t_{USER} configuration time is required after CDONE goes high and the FPGA receives the ENTERUSER instruction from the JTAG host (TAP controller in UPDATE_IR state).

Table 65: JTAG Mode

Symbol	Parameter	Min	Typ	Max	Units
f_{TCK}	TCK frequency.	-	-	10	MHz
t_{TDISU}	TDI setup time.	15	-	-	ns
t_{TDIH}	TDI hold time.	2.5	-	-	ns
t_{TMSSU}	TMS setup time.	15	-	-	ns
t_{TMSH}	TMS hold time.	2.5	-	-	ns
t_{TCKTDO}	TCK falling edge to TDO output.	-	-	30	ns

Pinout Description

The following tables describe the pinouts for power, ground, configuration, and interfaces.

Table 66: Power and Ground Pinouts

xx indicates the bank location.

Function	Description
VCC	Core power supply.
VCCA _{xx}	PLL analog power supply.
VCCAUX	1.8 V auxiliary power supply.
VCCIO33 _{xx}	HVIO bank power supply.
VCCIO _{xx}	HSIO bank power supply.
VCCIO _{xx_yy_zz}	Power for HSIO banks that are shorted together. xx, yy, and zz are the bank locations. For example: VCCIO1B_1C shorts banks 1B and 1C
GND	Ground.

Table 67: GPIO Pinouts

x indicates the location (T, B, L, or R); *xx* indicates the bank location; *n* indicates the number; *yyyy* indicates the function.

Function	Direction	Description
GPIOx_n	I/O	HVIO for user function. User I/O pins are single-ended.
GPIOx_n_yyyy	I/O	HVIO or multi-function pin.
GPIOx_N_n GPIOx_P_n	I/O	HSIO transmitter, receiver, or both.
GPIOx_N_n_yyyy GPIOx_P_n_yyyy	I/O	HSIO transmitter, receiver, both, or multi-function.
REF_RES_xx	-	<p>REF_RES is a reference resistor to generate constant current for the related circuits.</p> <p>Connect the following REF_RES pins to ground through a 10 kΩ resistor with a tolerance of ±1% :</p> <ul style="list-style-type: none"> • REF_RES_2A and REF_RES_4A pins must be connected • REF_RES pin of the particular bank, if pins in the bank are used as LVDS TX or MIPI TX lane. • REF_RES_3A pin, if internal oscillator is used. • REF_RES_3A pin, if blowing of fuses for FPGA security is required. <p>You can leave the REF_RES pins floating if none of the above are applicable.</p>

Table 68: Alternate Function Pinouts

n is the number.

Function	Direction	Description
CLKn	Input	Single ended input for global clock and control network resource. The number of inputs is package dependent.
PLLINn	Input	PLL reference clock resource. The number of reference clock resources is package dependent.

Table 69: Dedicated Configuration Pins

These pins cannot be used as general-purpose I/O after configuration.

Pins	Direction	Description	Use External Weak Pull-Up During Configuration
CDONE	I/O	Configuration done status pin. CDONE is an open drain output; connect it to an external pull-up resistor to VCCIO. When CDONE = 1, configuration is complete. If you hold CDONE low, the device will not enter user mode.	✓
CRESET_N	Input	Initiates FPGA re-configuration (active low). Pulse CRESET_N low for a duration of $t_{\text{creset_N}}$ before asserting CRESET_N from low to high to initiate FPGA re-configuration. This pin does not perform a system reset.	✓
TCK	Input	JTAG test clock input (TCK). The rising edge loads signals applied at the TAP input pins (TMS and TDI). The falling edge clocks out signals through the TAP TDO pin.	✓
TMS	Input	JTAG test mode select input (TMS). The I/O sequence on this input controls the test logic operation. The signal value typically changes on the falling edge of TCK. TMS is typically a weak pull-up; when it is not driven by an external source, the test logic perceives a logic 1.	✓
TDI	Input	JTAG test data input (TDI). Data applied at this serial input is fed into the instruction register or into a test data register depending on the sequence previously applied at TMS. Typically, the signal applied at TDI changes state following the falling edge of TCK while the registers shift in the value received on the rising edge. Like TMS, TDI is typically a weak pull-up; when it is not driven from an external source, the test logic perceives a logic 1.	✓
TDO	Output	JTAG test data output (TDO). This serial output from the test logic is fed from the instruction register or from a test data register depending on the sequence previously applied at TMS. During shifting, data applied at TDI appears at TDO after a number of cycles of TCK determined by the length of the register included in the serial path. The signal driven through TDO changes state following the falling edge of TCK. When data is not being shifted through the device, TDO is set to an inactive drive state (e.g., high-impedance).	✓

⁽¹⁸⁾ CDONE has a drive strength of 12 mA at 1.8 V.

Table 70: Dual-Purpose Configuration Pins

In user mode (after configuration), you can use these dual-purpose pins as general I/O.

Pins	Direction	Description	Use External Weak Pull-Up During Configuration
CBSEL[1:0]	Input	Optional multi-image selection input (if external multi-image configuration mode is enabled).	✓ ⁽¹⁹⁾
CCK	I/O	Passive SPI input configuration clock or active SPI output configuration clock.	Optional ⁽²⁰⁾
CDIn	I/O	<i>n</i> is a number from 0 to 31 depending on the SPI configuration. 0: Passive serial data input or active serial output. 1: Passive serial data output or active serial input. <i>n</i> : Parallel I/O. In multi-bit daisy chain connection, the CDIn (31:0) connects to the data bus in parallel.	Optional ⁽²⁰⁾
CSI	Input	Chip select. 0: The FPGA is not selected or enabled and will not be configured. 1: Selects the FPGA for configuration (SPI and JTAG configuration).	✓
CSO	Output	Chip select output. Selects the next device for cascading configuration. ⁽²¹⁾	N/A
NSTATUS	Output	Indicates a configuration error. When the FPGA drives this pin low, it indicates an ID mismatch, the bitstream CRC check has failed, or remote update has failed.	N/A
SSL_N	Input	Active-low configuration mode select. The FPGA senses the value of SSL_N when it comes out of reset (pulse CRESET_N low to high). 0: Passive mode 1: Active mode In active configuration mode, SSL_N serves as a chip select to the flash device 1 (CDI0 - CDI3).	Optional ⁽²⁰⁾
SSU_N	Output	In active configuration mode (dual quad mode), SSU_N serves as a chip select to the flash device 2 (CDI4 - CDI7).	Optional ⁽²⁰⁾
EXT_CONFIG_CLK	I/O	In active mode, EXT_CONFIG_CLK pin is connected to an external clock, to be used as a configuration clock.	Optional ⁽²⁰⁾
TEST_N	Input	Active-low test mode enable signal. Set to 1 to disable test mode. During configuration, rely on the external weak pull-up or drive this pin high.	✓

⁽¹⁹⁾ Not applicable to single-image or remote update.

⁽²⁰⁾ Optional unless pull-up is required by external load.

⁽²¹⁾ Cascaded configuration is not supported in the F100S3F2 package.

Ti35 Interface Floorplan

Note: The numbers in the floorplan figures indicate the HVIO and HSIO number ranges. Some packages may not have all HVIO or HSIO pins in the range bonded out. Refer to the **Ti35 Pinout** for information on which pins are available in each package.

Figure 44: Floorplan Diagram for F100S3F2 Packages

Figure 45: Floorplan Diagram for F225 Packages

Efinity Software Support

The Efinity[®] software provides a complete tool flow from RTL design to bitstream generation, including synthesis, place-and-route, and timing analysis. The software has a graphical user interface (GUI) that provides a visual way to set up projects, run the tool flow, and view results. The software also has a command-line flow and Tcl command console. The Efinity[®] software supports simulation flows using the ModelSim, NCSim, or free iVerilog simulators. An integrated hardware Debugger with Logic Analyzer and Virtual I/O debug cores helps you probe signals in your design. The software-generated bitstream file configures the Ti35 FPGA. The software supports the Verilog HDL and VHDL languages.

Ordering Codes

Refer to the [Titanium Selector Guide](#) for the full listing of Ti35 ordering codes.

Revision History

Table 71: Revision History

Date	Version	Description
February 2023	2.5	Standardized VCCA pin names. (DOC_1114) Added note about achieving maximum toggle rate. (DOC-1099) Added link in Power Up Sequence pointing to the Web Interactive Hardware Design Checklist and Guidelines. (DOC-1123) Updated REF_RES_3A pin connection requirement in the Pinout Description topic.
December 2022	2.4	Updated configuration pins external weak pull-up requirements. (DOC-1035) Added DPA specs and updated DPA description to support full-rate serialization mode only. (DOC-1078) Updated LVDS and sub-LVDS specs to include half-rate and full-rate serialization. (DOC-1078) Updated JTAG configuration timing specs. (DOC-1083)
October 2022	2.3	Updated REF_RES_xx pins connection requirement. (DOC-943)
September 2022	2.2	Updated t_{CRESET_N} spec. (DOC-876) Corrected MIPI RX Lane Block Diagram. (DOC-878) Removed GCTRL and RCTRL. (DOC-895) Added note recommending up to only 2 cascading PLLs. (DOC-931) Updated description about differential receivers are powered by VCCAUX. (DOC-929)
July 2022	2.1	Updated note about pins separation when using HSIO as GPIO, LVDS, or MIPI lanes. (DOC-769) Removed footnote in Minimum Power Supply Current Transient table. (DOC-818) Corrected SSU_N pin direction. Added note about I/O availability when enabling SPI flash memory access during user mode for F100S3F2 packages. (DOC-824) Updated I/O Banks by Package table.
April 2022	2.0	Updated test condition load to maximum load in Maximum Toggle Rate Table. (DOC-781) Corrected description for differential TX static programmable delay. (DOC-786) Added notes about VCC requirements in SPI flash memory and HyperRAM in F100S3F2 packages. (DOC-773) Added PLL period jitter spec with noisy input clock specs and updated test condition note. (DOC-771) Updated HyperRAM clock rate and double data rate speed in F100S3F2 packages. (DOC-793)

Date	Version	Description
April 2022	1.9	<p>Updated figure title for Connections for Clock and RX Data Lane in the Same MIPI RX Group. (DOC-739)</p> <p>Updated LVDS/RSDS/mini-LVDS RX supported VCCIO. (DOC-740)</p> <p>Updated Power Supply Current Transient and power sequence. (DOC-761)</p> <p>Corrected RD and RST signal directions in MIPI RX Lane Block Diagram.</p>
March 2022	1.8	<p>Updated power supply ramp rate and power up sequence diagram. (DOC-631)</p> <p>Updated external pull-up requirement for dual-purpose configuration pins. (DOC-734)</p>
February 2022	1.7	<p>Corrected t_H and t_{SU} parameter label in SPI Passive Mode (x1) Timing Sequence figure.</p> <p>Updated active and passive configuration timing specs. (DOC-708)</p> <p>Update 2.5 V LVCMOS V_{IH} and V_{IL} specs. (DOC-718)</p> <p>Added I_{IN} and V_{IN} specs. (DOC-652)</p> <p>Updated and improved clock and control network content and figures. (DOC-668)</p> <p>Updated MIPI and LVDS maximum toggle rate.</p> <p>Added note about the block RAM content is random and undefined if it is not initialized. (DOC-729)</p>
January 2022	1.6	Corrected Available Package Options.
January 2022	1.5	Merged MIPI and LVDS data rate specs into Maximum Toggle Rate table.
January 2022	1.4	<p>I/O banks for HVIO pins support dynamic voltage shifting. (DOC-444)</p> <p>Added Schmitt Trigger input buffer specs. (DOC-606)</p> <p>Added PLL reference clock input duty cycle specs. (DOC-661)</p> <p>Updated HVIO maximum toggle rate specs. (DOC-689)</p> <p>Removed I4 and I4L speed grades. (DOC-681)</p> <p>Updated global clock buffer, DSP, BRAM, HSIO as LVDS, and HSIO as MIPI lane specs. (DOC-693)</p> <p>Added internal weak pull-up resistor and drive strength specs for CDONE and CRESET_N. (DOC-635)</p> <p>Added ambient storage temperature spec. (DOC-678)</p>
November 2021	1.3	<p>Updated REF_RES_xx description and resistor tolerance. (DOC-602, DOC-603, DOC-605)</p> <p>Added Ordering Codes topic. (DOC-637)</p> <p>Added SRL8 resource number. (DOC-596)</p> <p>Added global clock buffer block characteristics. (DOC-577)</p> <p>Updated power up sequence, updated power supply ramp rates, updated t_{CRESET_N} and added power supply current transient specs. (DOC-643)</p>

Date	Version	Description
November 2021	1.2	<p>Added internal weak pull-up and pull-down specs for HVIO and HSIO. (DOC-561)</p> <p>Updated the SHIFT[2:0] description in PLL Signals table and Dynamic Phase Shift topic. (DOC-570)</p> <p>Updated note about leaving unassigned pins when using HSIO as GPIO, LVDS, or MIPI lanes. (DOC-581)</p> <p>Updated the Security Feature topic. (DOC-538)</p> <p>Added a note in the Single Event Upset Detection topic referring to the Titanium Interfaces User Guide for details on using this feature.</p> <p>Updated LVDS standard compliance which is TIA/EIA-644. (DOC-592)</p> <p>Updated F100 package name to F100S3F2. (DOC-593)</p>
October 2021	1.1	<p>Updated the Security Feature topic.</p> <p>Updated DIV 2 active mode f_{MAX_M} typical and maximum values. (DOC-509)</p> <p>Added F_{PLL} specs and updated the PLL block diagram to include F_{PLL}. (DOC-512)</p> <p>Added note stating that all PLL outputs lock on the negative clock edge. (DOC-511)</p> <p>Updated sub-LVDS maximum toggle rate. (DOC-541)</p> <p>Added description about CLKOUT0 limitation. (DOC-533)</p> <p>Updated HyperRAM double-data rates to up to 500 Mbps. (DOC-554)</p> <p>Added connection requirements for unused resources in Power Up Sequence topic.</p>
June 2021	1.0	Initial release.
